RE: Project A-232-299

Dear Dr. Meloon:

Stereoscopic views of shadowed sections of GT-9 are enclosed. These do not give as much information about crystallite size and shape as I had hoped. The fracture and replication technique may be better.

Some porosity is evident other than effects caused by difficulty in sectioning. We have just received a new diamond knife and should be able to cut the samples which are not successful with a glass knife.

Prints of these stereos will be forwarded to you when they are ready.

Very truly yours,

John L. Brown, Head
Analytical Instrumentation Labs
