Solutions to Activities in Recitation Slides 223

About This Document

This resource contains curriculum for the distance education version of a course offered at the Georgia Institute of Technology, Math 1502, in Fall 2014. This distance education course explored linear algebra, infinite series, and differential equation concepts during lectures and recitations. Recitations are synchronous sessions that offer students an opportunity to apply and review course concepts, which they have been exposed to in lectures. Contained in this curriculum are materials for 26 recitations, available in PDF and presentation slide formats. The slide format is offered for teaching assistants to import directly into web-conferencing software. Slides contain activities that students would solve during recitations. The associated notes contain solutions to corresponding activities and are available in PDF format. A similar version of this work, that corresponds to activities conducted in the Spring 2014 semester is available through SMARTech at https://smartech.gatech.edu/handle/1853/52896

For Further Information

Questions regarding this document can be directed to Greg Mayer (gsmayer@gmail.com), who would be happy to hear your suggestions on how to improve this document.
### Schedule of Activities

The following table presents a list of topics that were explored in the recitation activities. Numbers in brackets correspond to section numbers in the course textbook (Lay, D., Linear Algebra and its Applications, Fourth Edition).

Welcome Back!

This session is an opportunity to make sure that your computer is ready for recitations and to familiarize yourself with the software we are using.
Recitation 01: Welcome Back!

Today: Course Organization, Vector Representations of Curves (13.1)
Thursday: Quadratic Surfaces (12.6)

Start-of-Term Survey
Please fill out if you haven’t already:

Graded Recitation Activities This Semester
• details sent via email
• group work, in Adobe Connect, count towards your pop quiz grade

WebEx and Adobe Connect
1. WebEx for first two weeks
2. online survey to determine if we want to continue using WebEx
3. Adobe Connect for graded group work activities and pop quizzes

Other Announcements
• Piazza isn’t set-up yet
• Tegrity is set-up, can view yesterday’s lecture (let me know if you can’t)
• Two MML HWs due Monday
Quiz and GRA Dates

Tentative Quiz Dates
• Quiz 1: Thursday, January 29
• Quiz 2: Thursday, February 19
• Quiz 3: Thursday, March 12
• Quiz 4: Thursday, April 9

GRAs: Tuesdays before quizzes
• Tue Jan 27
• Tue Feb 17
• Tue Feb 10
• Tue Apr 7

We may have additional GRAs.

Final Exam Exemption and Quizzes
• no mention of exemption in syllabus or course calendar
• the most difficult material in this course is at the end of the semester
Objectives
Throughout this course we find parametric representations of motion and use them to characterize motions.

Today’s Learning Objectives
Characterize the two (or three) dimensional motion of an object, in parametric form, in terms of its
• velocity and acceleration
• unit tangent vector

Later in this course we’ll use parametric representations of curves to calculate curvature, path length, momentum, and other ways of describing a motion.

I’m assuming you’ve seen parametric representation of curves in lecture.
Parametric Representation

Find a parametric representation of the counterclockwise motion that travels along the curve $4x^2 + 9y^2 = 36$. Sketch the motion.
Wolfram Alpha Syntax

This is the syntax you would use for plotting parametric curves in WolframAlpha.

plot $x(t) = 3\cos(t), y(t) = 2\sin(t)$
Position, Velocity and Acceleration

The position of an object is given by the curve $\mathbf{r}(t) = \sin(t)\mathbf{i} + \cos(t)\mathbf{j}$, for all $t$.

a) Sketch the curve.

b) When are the position and velocity vectors perpendicular?

c) When do the position and acceleration vectors have the same direction?

d) Calculate the unit tangent vector for all $t$. 
Position and Velocity

The position of a particle is given by $\mathbf{r}(t)$. Describe situations where the following is true for all values of $t$.

$$\mathbf{r}(t) \cdot \frac{d\mathbf{r}}{dt} = 0$$
Parametric Vector Representation

Find a parametric vector representation, \( r(t) \), of the curve that satisfies the following equations, and \( y \) increases when \( x \) is positive. Sketch the motion.

\[
z = \sqrt{x^2 + y^2}, \quad y = x
\]
Parametric Vector Representation

Find a parametric vector representation, \( r(t) \), of the curve that satisfies the following equations, and \( z \) decreases when \( x \) is positive. Sketch the motion.

\[
z = \sqrt{4 - x^2 - y^2}, \quad y^2 + x^2 - 2y = 0
\]
Recitation 02

Today: Vector Representations of Curves (13.1), Quadratic Surfaces (12.6)

Start-of-Term Survey
Please fill out if you haven’t already:

Last Recitation
• Find parametric representations of given curves
• Characterize motion of an object, in parametric form, in terms of its
  o velocity and acceleration
  o unit tangent vector

Today
• Identify and sketch quadratic surfaces given their algebraic equations

Don’t Forget

Evidence of inappropriate behavior will be forwarded to the course instructors, and possibly also to the chair of the School of Mathematics and High school facilitators. Evidence will be reviewed to determine if further action is required. Such action could either result in the Georgia Tech's Office of Undergraduate Admissions being made aware of student behavior, and/or all students from a particular school moved to another section where interactions between students from different schools is not possible. Behavior is inappropriate if it can interpreted as hurtful or disrespectful. Students can request to be moved to another section at any time. Questions can be directed to the students teaching assistant and/or the course instructors at any time.
Quadratic Surfaces (12.6)

Sketch and describe the surface $5x^2 + 2y^2 - z^2 = -10$. 
Quadratic Surfaces (12.6)

Sketch and describe the surface $5x^2 + 2y^2 - z^2 = -10$.

**Geometric figure:**

two-sheeted hyperboloid
Quadratic Surfaces

The textbook should list and describe every quadratic surface that you need to be familiar with (but the online textbook currently doesn’t work). Wikipedia also has a page that lists and describes every possible quadratic surface (for our course):
http://en.wikipedia.org/wiki/Quadric

Below are four surfaces:

Ellipsoid

\[
\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1
\]

Hyperbolic paraboloid

Elliptic paraboloid

\[
\frac{x^2}{a^2} + \frac{y^2}{b^2} - z = 0
\]

Elliptic hyperboloid of one sheet

\[
\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1
\]
Quadratic Surfaces

Identify the correct answer.

The set of all points whose distance from the z-axis is 4 is the:

a) sphere of radius 4 centered on the z-axis
b) line parallel to the z-axis 4 units away from the origin
c) cylinder of radius 4 centered on the z-axis
d) plane $z = 4$
Parametric Vector Representation and Quadratic Surfaces

Find a parametric vector representation of the curve, $r(t)$, that satisfies both quadratic surfaces. Sketch $r(t)$ and both surfaces.

$$z = x^2 + y^2, \quad 5 = x^2 + y^2$$
Consider the surface $z = Ax^2 + By^2$, where $A$ and $B$ are constants. Identify all possible surfaces for the following cases.

i) $A = B = 0$

ii) $AB > 0$
Parametric Vector Representation and Quadratic Surfaces

The following surfaces intersect along a curve, C. Find a) the projection of C onto the xy-plane and b) the parametric vector representation of the projection.

\[ z = x^2 + y^2, \quad z = 2y + 3 \]
Recitation 03

Today: Group Work on Vector Representations of Curves, Quadratic Surfaces

Hello from San Antonio! Your instructor and I are at a large annual math conference. I hope the wifi is going to hold up for our recitation this morning, many apologies if it doesn’t. In case you’re interested, this the conference website: http://jointmathematicsmeetings.org/jmm

Textbook: technical issues should be resolved now

Start-of-Term Survey
Please fill out if you haven’t already (survey closes Wednesday at midnight):

Today: Quadratic Surfaces and Parametric Vectors
• Find parametric representations of given curves
• Characterize motion of an object, in parametric form, in terms of its velocity and acceleration, unit tangent vector
• Identify and sketch quadratic surfaces given their algebraic equations
Group Work Questions

Complete each problem in small groups. The first four questions are from old Math 2401 quizzes (2013 and 2014).

1) Consider the twisted cubic \( r(t) = ti + t^2j + t^3k \) and the plane \( x + 2y + 3z = 34 \).
   a) Where does the cubic intersect the plane?
   b) Find the cosine of the tangent to the curve and the normal to the plane.

2) Find the intersection of the surface \( x^2 + 2y^2 = z \) and the plane \( x - y = 5 \). A parameterization would be fine.

3) Consider the surface \( x^2 - 6x + 4y + y^2 + 8z - z^2 = 4 \).
   a) Find the center of the surface.
   b) Name the surface.
   c) Draw a picture of the surface, labelling the center and axes.

4) Consider the surface \( 9x^2 - 18x - 16y + 4y^2 - 4z^2 = 11 \).
   a) Find the center of the surface.
   b) Name the surface.
   c) Draw a picture of the surface, labelling the center and axes.

5) Create a vector function, \( r(t) \), on the interval \([0, 2\pi]\), that satisfies the conditions
   \( r(0) = ai \), and as \( t \) increases from \( 0 \) to \( 2\pi \), traces out an ellipse \( b^2x^2 + a^2y^2 = a^2b^2 \), twice
   in a counterclockwise manner.
1) Consider the twisted cubic $r(t) = ti + t^2j + t^3k$ and the plane $x + 2y + 3z = 34$.
   
   a) Where does the cubic intersect the plane?
   
   b) Find the cosine of the tangent to the curve and the normal to the plane.
2) Find the intersection of the surface $x^2 + 2y^2 = z$ and the plane $x - y = 5$. A parameterization would be fine.
3) Consider the surface \( x^2 - 6x + 4y + y^2 + 8z - z^2 = 4. \)
   
   a) Find the center of the surface.
   
   b) Name the surface.
   
   c) Draw a picture of the surface, labelling the center and axes.
4) Consider the surface $9x^2 - 18x - 16y + 4y^2 - 4z^2 = 11$.
   
   a) Find the center of the surface.
   
   b) Name the surface.
   
   c) Draw a picture of the surface, labelling the center and axes.
5) Create a vector function, \( \mathbf{r}(t) \), on the interval \([0, 2\pi]\), that satisfies the conditions \( \mathbf{r}(0) = a\mathbf{i} \), and as \( t \) increases from 0 to \( 2\pi \), traces out an ellipse \( b^2x^2 + a^2y^2 = a^2b^2 \), twice in a counterclockwise manner.
Recitation 04

Today: Displacement, Velocity, Acceleration (13.2), Path Length (13.3)

Homework: Due Tonight and Monday

Learning Objectives for Today: Characterize motion of an object, in parametric form, in terms of its unit tangent vector, acceleration, path length (aka arc length).

Photo by Wikimedia Commons user Kreuzschnabel
Particle Motion

Let \( r(t) = x(t)i + y(t)j + z(t)k \).

a) How is the unit tangent vector, \( T(t) \), defined mathematically?

b) Suppose \( x = t^2 \), \( y = t^3 \), \( z = t^2 \), and \( t \geq 0 \). Then what is the unit tangent vector when \( t = 0 \)?
Differential Equation

Solve the following initial value problem.

\[ \ddot{\mathbf{F}}(t) = m \dddot{\mathbf{r}}(t) = t \mathbf{i} + t^2 \mathbf{j}, \quad \mathbf{r}(0) = \mathbf{i}, \quad \mathbf{v}(0) = \mathbf{k}. \]
**Velocity and Acceleration**

What constant acceleration must a particle experience if it is to travel from (1,2,3) to (4,5,7) along the straight line joining the points, starting from rest, and covering the distance in 2 units of time?
Velocity and Position

$r(t)$ is the position of a moving particle.

a) Describe, in words, what $r'$ is parallel to.

b) Show that $|\|r(t)\||$ is constant iff $r \perp r'$
The Hanging Cable

The hanging cable, also referred to as a _____________, has the shape:
A cable is suspended between two poles that are 10 m apart. Find the length of the cable, if the cable’s shape is $y(x) = k [\cosh(x/k) - 1]$. 
Recitation 05

Today’s Topics

• Projectile Motion (13.2)
• Path Length and Tangential Vector (13.3)
• Curvature & Normal Vectors (13.4)

Today’s Learning Objectives

• Apply vector function integration to determine path of projectiles
• Characterize motion of an object, in parametric form, in terms of its arc length and its tangential, normal and binormal vectors
Announcements

Survey Results: students want to collaborate, have trouble with technical issues and not knowing how to solve problems in group work. So let's use Adobe Connect, keep group size to 4 to 6, use group work on stuff covered from last assignments.

Thursday Recitation: 13.4, 13.5, Adobe Connect
Graded Recitation Activity: Next week during Tuesday recitation, question coming soon
HW Due Tomorrow: 13.4, 13.5
Quiz 1: Thur Jan 29
Office Hours: 7:30 pm – 8:30 pm, Wed Jan 21, Wed Jan 28
https://georgiatech.adobeconnect.com/distancecalculusofficehours

Send Your TA an Email
Explain, in an email, using your own words, what the following quantities represent:

• the unit tangent vector, $T(t)$
• the curvature, $\kappa$

Try to send this email by the end of the day today. If you send your TA an email with a description of what these quantities represent, you will get a reply.
Ideal Projectile Motion: \( \vec{r}(t) = (v_0 \cos \alpha) \hat{i} + \left( (v_0 \sin \alpha) t - \frac{gt^2}{2} \right) \hat{j} \)

\( v_0 \) is the __________________ , and \( \alpha \) is the __________________________.

max range: \( R = \frac{v_0^2 \sin 2\alpha}{g} \)  
max height: \( \frac{v_0^2 \sin^2 \alpha}{2g} \)

Unit tangent vector \( T = \) ________________

Principle unit normal vector \( N = \) ________________

Binormal vector \( B = \) ________________
1) Ball Rolling off of a Table (Projectile Motion, 13.2)
A ball rolls off a table 1 meter high with a speed of 0.5 m/s.
   a) At what speed does the ball strike the floor?
   b) Where does the ball strike the floor?

2) Golf Ball (Projectile Motion, 13.2)
A golfer can send a golf ball 300m across a level ground. From the tee in the figure, can the golfer clear the water?

3) Arc Length, Normal and Binormal Vectors (13.3, 13.4)
Consider the surfaces $x^2 + y^2 + z^2 = 4$, and $z^2 = x^2 + y^2$ for $z \geq 0$.
   a) Find a parameterization for the intersection curve, $\mathbf{r}(t)$, of the two surfaces.
   b) Sketch the two surfaces and their intersection.
   c) Calculate the length of $\mathbf{r}(t)$.
   d) Find the unit tangent, normal, and binormal vectors for $\mathbf{r}(t)$ at the point
      $(\sqrt{2}, 0, \sqrt{2})$.
   e) Add the three vectors to your sketch.
1) Ball Rolling off of a Table (Projectile Motion, 13.2)
A ball rolls off a table 1 meter high with a speed of 0.5 m/s.
a) At what speed does the ball strike the floor?
1) Ball Rolling off of a Table (Projectile Motion, 13.2)
A ball rolls off a table 1 meter high with a speed of 0.5 m/s.
b) Where does the ball strike the floor?
A golfer can send a golf ball 300m across a level ground. From the tee in the figure, can the golfer clear the water?
3) Arc Length, Normal and Binormal Vectors (13.3, 13.4)
Consider the surfaces \( x^2 + y^2 + z^2 = 4 \), and \( z^2 = x^2 + y^2 \) for \( z \geq 0 \).

a) Find a parameterization for the intersection curve, \( r(t) \), of the two surfaces.

b) Sketch the two surfaces and their intersection.

c) Calculate the length of \( r(t) \).

d) Find the unit tangent, normal, and binormal vectors for \( r(t) \) at the point \((\sqrt{2}, 0, \sqrt{2})\).

e) Add the three vectors to your sketch.
3) Arc Length, Normal and Binormal Vectors (13.3, 13.4)
Consider the surfaces $x^2 + y^2 + z^2 = 4$, and $z^2 = x^2 + y^2$ for $z \geq 0$.
c) Calculate the length of $r(t)$. 
3) Arc Length, Normal and Binormal Vectors (13.3, 13.4)

Consider the surfaces \(x^2 + y^2 + z^2 = 4\), and \(z^2 = x^2 + y^2\) for \(z \geq 0\).

d) Find the unit tangent, normal, and binormal vectors for \(\mathbf{r}(t)\) at the point \((\sqrt{2}, 0, \sqrt{2})\).

e) Add the three vectors to your sketch.
Recitation 06

Today’s Topics:

• Curvature & Normal Vectors (13.4)
• Tangential and Normal Components of Acceleration (13.5)
• Velocity and Acceleration in Polar Coordinates (13.6)

Today’s Learning Objectives

1. Given a motion of an object, in either parametric form or as a function of a single variable, calculate the
   • curvature
   • tangent, normal, and binormal vectors
   • acceleration (tangential and normal components)
   • torsion
2. Calculate the osculating, normal, and rectifying planes for a given curve $\mathbf{r}(t)$ at a given value of $t$
Helpful Formulas

principle normal vector: $\vec{N} = \frac{\vec{T}'(t)}{|\vec{T}'(t)|}$

curvature: $\kappa = \frac{1}{|\vec{v}|} |\vec{T}'(t)|$

curvature: $\kappa = \frac{|f''(x)|}{\left[1 + (f'(x))^2\right]^{3/2}}$

acceleration: $\vec{a} = a_T \vec{T} + a_N \vec{N}$

$a_T = \frac{d}{dt} |\vec{v}|$

$a_N = \sqrt{|\vec{a}| + |a_T|}$

torsion: $\tau = \frac{\begin{vmatrix} x' & y' & z' \\ x'' & y'' & z'' \\ x''' & y''' & z''' \end{vmatrix}}{|\vec{v} \times \vec{a}|^2}$

Notes:

- One of the above equations has an error, where is it?
- There are alternate expressions for these formulas. Above are the formulas that the textbook uses.
Normal, Rectifying, and Osculating Planes

The geometry of the three planes determined by vectors $\mathbf{T}$, $\mathbf{N}$, and $\mathbf{B}$, for curve $\mathbf{r}(t)$, at $\mathbf{r}(t_0)$.

If a motion, $\mathbf{r}(t)$, lies completely in a plane, then the binormal vector is ______________.
Announcements

Graded Recitation Activity: Next week during Tuesday recitation, question sent
HW Due Tomorrow: 13.6
Quiz 1: Thur Jan 29
Office Hours: 7:30 pm – 8:30 pm, Wed Jan 28
https://georgiatech.adobeconnect.com/distancecalculusofficehours

Send Your TA an Email

Using your own words, describe

• the relationship between the curvature and the normal plane
• the relationship between the torsion and the osculating plane

Try to send an email with your answers by the end of the day today. If you send your TA an email with an answer to these questions you will get a response.

Hint: these relationships are described in the textbook.
Group Work Activity: Part (a)

There are four parts to the following question. Solve them in groups of 3 to 5 students.

Consider \( \mathbf{r}(t) = \sin(t)\mathbf{i} + \cos(t)\mathbf{j} + \mathbf{k}, \quad t = -\pi/2. \)

a) Find \( \mathbf{T}, \mathbf{N}, \) and \( \mathbf{B} \) at the given value of \( t \). Is \( \mathbf{B} \) constant for all values of \( t \)?
Group Work Activity: Parts (b) and (c)

Consider $\mathbf{r}(t) = \sin(t)\mathbf{i} + \cos(t)\mathbf{j} + \mathbf{k}$, $t = -\pi/2$.

b) Sketch $\mathbf{r}$ for $[0, 2\pi]$ and indicate the direction of motion.

c) Sketch $\mathbf{T}$, $\mathbf{N}$, and $\mathbf{B}$ at the given value of $t$. 
Group Work Activity: Part (d)

Consider \( \mathbf{r}(t) = \sin(t)\mathbf{i} + \cos(t)\mathbf{j} + \mathbf{k}, \ t = -\pi/2. \)

d) Find the equation of the normal plane at \( t = -\pi/2. \)

*Message your TA when you’ve finished this question. Move on to the remaining questions after this if there is time.*
True or False

a) Curvature is a scalar and can be any real number.

This statement is ______________ because:

b) Torsion is a scalar and can be any real number.

This statement is ______________ because:

c) If \( \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} \), then the normal vector, \( \mathbf{N} \), is given by \( \mathbf{N} = \mathbf{n}/|\mathbf{n}| \), where \( \mathbf{n} = -x'(t)\mathbf{i} + y'(t)\mathbf{j} \).

This statement is ______________ because:
Recitation 07

Today’s Topics: Quiz 1 Review, Graded Recitation Activity 1

Quiz 1 Topics
12.6 Quadratic Surfaces
13.1 Vector Parametric Representations of Curves
13.2 Quadratic Surfaces
13.2 Projectile Motion
13.2 Path Length
13.3 Curvature & Normal Vectors
13.5 Tangential & Normal Components of Acceleration
Quiz 1 Learning Objectives

You should be able to do the following for Quiz 1.

• Identify and sketch quadratic surfaces given their algebraic equations
• Develop parameteric representations of curves
• Integrate vector functions to determine projectile motion
• Characterize a motion, given in either parametric form \( \mathbf{r}(t) \), or as a continuous function \( f(x) \), using:
  • vectors: velocity, acceleration, tangent, binormal
  • scalars: curvature, torsion, tanential & normal components of accel, arc length
  • planes: tangential, rectifying, ________
Interpretations of Curvature and Torsion

Curvature is the rate at which the ________________ turns.

Torsion is the rate at which the ________________ turns.
Helpful Formulas

Ideal Projectile Motion: \( \vec{r}(t) = (v_0 \cos \alpha) \hat{i} + \left( (v_0 \sin \alpha) t - \frac{gt^2}{2} \right) \hat{j} \)

Graded Group Work Activity

Instructions
• Every student in your group needs to write their name or initials on the board.
• You have 20 minutes to answer the questions below.
• For full marks, show at least three intermediate steps for each question.
• Answer each question on a different slide.
• All students in the same group receive the same grade.
• Please do not share computers: every student should log in on their own computer.
• You do not need to simplify your answers
• You can use \( c = \cos(t) \) and \( s = \sin(t) \)

1) Tangential & Normal Components of Acceleration (4 points)
Let \( r(t) = 2t\mathbf{i} + tj + 2t^2\mathbf{k} \) be a motion. Compute the tangential and normal components of the acceleration.

2) Arc Length (2 points)
Find the arc length, from 0 to \( t \), of the curve \( r(t) = e^t\cos(t)\mathbf{i} + e^t\sin(t)\mathbf{j} + 5e^t\mathbf{k} \).
1) Tangential & Normal Components of Acceleration (4 points)

Let \( r(t) = 2t \mathbf{i} + tj + 2t^2 \mathbf{k} \) be a motion. Compute the tangential and normal components of the acceleration.
2) Arc Length (2 points)

Find the arc length, from 0 to t, of the curve \( r(t) = e^t \cos(t) \mathbf{i} + e^t \sin(t) \mathbf{j} + 5e^t \mathbf{k} \).
Curvature and Torsion

This question has 4 parts. Consider the surfaces $z = x^2 + y^2$ and $y = 2$, for $z \geq 0$.

A) Find a parametric vector representation for their intersection.
B) Sketch the intersection and the 2 surfaces.
Curvature and Torsion

This question has 4 parts. Consider the surfaces $z = x^2 + y^2$ and $y = 2$, for $z \geq 0$.
C) Calculate the curvature and identify on your sketch where the curvature is maximized.
Curvature and Torsion

This question has 4 parts. Consider the surfaces $z = x^2 + y^2$ and $y = 2$, for $z \geq 0$.

D) Calculate the torsion of the intersecting curve and explain your answer.
Recitation 09

R09 Topics
14.1 Functions of Several Variables
14.2 Limits and Continuity

R09 Learning Objectives
By the end of today’s session you should be able to

▶ Identify and sketch the domain of a function of several variables.
▶ Determine whether or not limits of functions of several variables exist.

While We’re Waiting to Start
Consider the function

\[ g(x, y) = \frac{\sqrt{y + 1}}{x^2 y + xy^2}. \]

For \( g(x, y) \) to be defined and a real-valued function, what values of \( x \) and \( y \) can we allow?
Domain of a Function of Two Variables

Identify and sketch the domain of

\[ g(x, y) = \frac{\sqrt{y + 1}}{x^2y + xy^2}. \]
Limits of a Function of Two Variables

Consider the function of two variables

\[ f(x, y) = \frac{x(x - 1)^3 + y^2}{4(x - 1)^2 + 9y^3}. \]

We want to evaluate

\[ \lim_{(x, y) \to (1, 0)} f(x, y) \]

What strategies might we try to evaluate the desired limit?
Limits of a Function of Two Variables, Example 1

Evaluate

\[
\lim_{(x,y) \to (1,0)} \frac{x(x - 1)^3 + y^2}{4(x - 1)^2 + 9y^3}
\]
Limits of a Function of Two Variables, Example 2

In groups of 3 to 5 students, evaluate the limit

$$\lim_{(x,y) \to (0,0)} \frac{xy^2}{x^2 + y^4}.$$
Definition of Limit

Evaluating limits along paths will not show that a given limit exists. To show that a limit exists, we can use the definition of limit.

The limit of $f(x, y)$ as $(x, y)$ approach $(a, b)$ is $L$ if for every number $\epsilon > 0$, there is a corresponding $\delta > 0$ such that

$$|f(x, y) - L| < \epsilon \quad \text{when } 0 < \sqrt{(x - a)^2 + (y - b)^2} < \delta$$

In other words, the distance between $f$ and $L$ can be made arbitrarily small by making the distance from $(x, y)$ to $(a, b)$ sufficiently small.
An Epsilon Delta Example

Evaluate, or show that the following limit does not exist.

\[
\lim_{(x,y) \to (0,0)} \frac{3x^2y}{x^2 + y^2}.
\]
An Epsilon Delta Example
An Epsilon Delta Example
An Epsilon Delta Example
Conclusions: Evaluating Limits of Multivariable Functions

Suppose we need to evaluate a limit of a function of two variables

\[
\lim_{(x,y) \to (a,b)} f(x, y).
\]

If we know that \( f(x, y) \) is continuous at \((a, b)\), we can evaluate the limit with direct substitution. If we don't know that \( f(x, y) \) is continuous at \((a, b)\), we can either

- evaluate the limit along curves \((y = mx, \text{ for example})\) to see if the limit does not exist, or
- we can use the definition of limit to prove that the limit does exist and determine what the limit is equal to.

Notes:

- evaluating a limit along curves cannot tell us that a given limit exists, it can only tell us whether it doesn’t exist
- I’m assuming you’re familiar with continuity for a function of several variables, but if you aren’t it’s on the next homework and isn’t a difficult concept.
Recitation 11

R11 Topics
14.5 The Gradient

R11 Learning Objectives
By the end of today’s session you should be able to do the following.

▶ Compute gradients and directional derivatives.
▶ Provide geometric interpretations of gradients and directional derivatives.
▶ Describe the relationship between gradients and level curves.

While We’re Waiting to Start
Consider $f(x, y) = y^2 e^{2x}$.

1. Find the direction of steepest ascent at $P(0, 1)$ and at $Q(0, -1)$.
2. Sketch the level curves of $f$, and the gradient vectors at $P$ and $Q$.
3. Find the rate at which $f$ is increasing in the direction $\vec{u} = \hat{i} - \hat{j}$ at $P$. 
The Gradient and Directional Derivative

Consider \( f(x, y) = y^2 e^{2x} \).

1. Find the direction of steepest ascent at \( P(0, 1) \) and at \( Q(0, -1) \).
2. Sketch the level curves of \( f \), and the gradient vectors at \( P \) and \( Q \).
3. Find the rate at which \( f \) is increasing in the direction \( \vec{u} = \hat{i} - \hat{j} \) at \( P \).
The Gradient and Directional Derivative
Wolfram Alpha’s Plots of $f(x, y)$

In case it helps see what is going on, to the left are plots of our function, $y^2 e^{2x}$, that WolframAlpha produces.

Notice that the contour plot gives a set of level curves.
Level Curves

If $C$ is in the ________________ of $f(x, y)$, then the curve $C = f(x, y)$ is a **level curve** of $f(x, y)$. For functions of two variables, we can think of level curves as curves of constant **height** (analogous to topographic maps, that have curves of constant elevation).

In other words, a level curve is an intersection between $f(x, y)$ and the plane $z = C$. Level curves are a useful view of the overall behavior of a function.

Banaba Island image under a CCBY2.0 license, available from https://www.flickr.com/photos/evsmap
Level Curves and the Gradient

*This following helps explain why the gradient is $\perp$ to level curves.*

Let $C = g(x, y)$ be a level curve of $g(x, y)$. Show that $\nabla g$ is always perpendicular to the level curve.
A Conceptual Question: The Gradient

At which point does the gradient vector have the largest magnitude? Draw the gradient at this point.

1. (0,0)
2. (8,-8)
3. (6,-2)
4. (-4,-4)
Group Work Activities

Solve the following in groups of 3 to 5 students.

1. Find the directional derivative of \( f = z \ln(x/y) \) at \((1, 1, 2)\) towards the point \((2, 2, 1)\) and provide a geometric interpretation of your answer.

2. For \( z = 3xy - x^3 - y^3 \), find the points where the gradient vector is the zero vector. Provide a geometric interpretation of your answer.

3. Suppose \( \vec{F} = \nabla f(x, y) = (2x + \sin y)\hat{i} + (x \cos(y) - 2y)\hat{j} \). Find \( f(x, y) \).
Question 1: A Directional Derivative

Find the directional derivative of \( f = z \ln(x/y) \) at \((1, 1, 2)\) towards the point \((2, 2, 1)\). Provide a geometric interpretation of your answer.
Question 2: Zero Gradient

For \( z = 3xy - x^3 - y^3 \), find the points where the gradient vector is the zero vector. Provide a geometric interpretation of your answer.
Question 3: Constructing a Function From its Gradient

Suppose $\vec{F} = \nabla f(x, y) = (2x + \sin y)i + (x \cos(y) - 2y)j$. Find $f(x, y)$. 
Recitation 12

R12 Topics
14.6 Tangent Planes and Differentials
14.7 Absolute Min/Max

R12 Learning Objectives
By the end of today’s session you should be able to do the following.

▶ Find equations of tangent planes and normal lines of surfaces.
▶ Apply tangent planes and differentials to make approximations.
▶ Locate and classify critical points of surfaces.

Example 1
Consider the surface $x^2 + 4y^2 = z^2$.

1. Find the equation of the tangent plane at $P(3, 2, 5)$.
2. Find the equation of the normal line at $P$, and identify where the normal line intersects the $xy$-plane.
3. Sketch the surface and the normal line.
Example 1: Part 1

Consider the surface $x^2 + 4y^2 = z^2$. Find the equation of the tangent plane at $P(3, 2, 5)$. 
Example 1: Part 2

Consider the surface \( x^2 + 4y^2 = z^2 \). Find the equation of the normal line at \( P(3, 2, 5) \), and identify where the normal line intersects the xy-plane.
Example 1: Part 3

Consider the surface \( x^2 + 4y^2 = z^2 \). Sketch the surface and the normal line.
Tangent Planes and Differentials (14.6)

For a function of one variable, \( y(x) \), we define the differential \( dy \) as

\[
dy = \frac{dy}{dx} dx,
\]

where \( dy \) is the change in height of the tangent line.

For a function of two variables, \( z(x, y) \), we define the differential \( dz \) as

\[
dz = \text{__________},
\]

where \( dz \) is the change in height of the __________.

The equation of the tangent plane to \( z = z(x, y) \) at the point \( \vec{r}_0 \) is

\[
z = z_0 + \nabla z \cdot (\vec{r} - \vec{r}_0)
\]

The vector \( \vec{r} - \vec{r}_0 \) is a vector in the tangent plane.
A Quick Calculation: Tangent Plane Approximation

Suppose \( z_x(3, 4) = 5 \), \( z_y(3, 4) = -2 \), and \( z(3, 4) = 6 \). Assuming the function \( z \) is differentiable, what is the best estimate for \( z(3.1, 3.9) \) using this information?

1. 6.3
2. 9
3. 6
4. 6.7
Estimating Change in Volume

Estimate, using the tangent plane approximation, the change in volume of a cylinder if its height is changed from 12.0 to 12.2 cm and the radius is changed from 8.0 to 7.7 cm. How much does the volume actually change?
Second Derivative Test (14.7)

Suppose $f$ has continuous $2^{nd}$ order partial derivatives around some point $P(x_0, y_0)$, and that $\nabla f(x_0, y_0) = 0$. Let

$$D = \frac{\partial^2 f}{\partial x^2} \frac{\partial^2 f}{\partial y^2} - \left( \frac{\partial^2 f}{\partial x \partial y} \right)^2$$

If $D = 0$, then __________._
If $D < 0$, then $P$ is a saddle point.
If $D > 0$, then $P$ is a maximum if $f_{xx} < 0$ and a minimum if $f_{xx} > 0$. 
Optimization

Find the critical points of $f(x, y) = y + x \sin(y)$ and determine whether they correspond to local or absolute minimums or maximums of $f(x, y)$. 
Surface Plot of $f(x, y) = y + x \sin(y)$

plot $y + x\sin(y)$

Input interpretation:

plot $y + x\sin(y)$

3D plot:
Group Work Activities

Solve the following in groups of 3 to 5 students.

1. Consider the function \( f(x, y) = 3xy - x^3 - y^3 \).
   1.1 Find the points where the gradient vector, \( \nabla f(x, y) \), is the zero vector.
   1.2 Find the points where the tangent plane is horizontal.
   1.3 Find the critical points of \( f(x, y) \). Classify these points as min, max, or saddle points.

2. Find an equation of the tangent plane and normal line to \( z = (x^2 + y^2)^2 \) at \( P(1, 1, 4) \).
Question 1.1: Zero Gradient

For $f = 3xy - x^3 - y^3$, find the points where the gradient vector, $\nabla f(x, y)$, is the zero vector.
Questions 1.2 and 1.3

Consider the function $f(x, y) = 3xy - x^3 - y^3$. Find the points where the tangent plane is horizontal. Find the critical points of $f(x, y)$. Classify these points as min, max, or saddle points.
Question 2

Find an equation of the tangent plane and normal line to \( z = (x^2 + y^2)^2 \) at \( P(1, 1, 4) \).
Recitation 16

R16 Topics
14.8 Lagrange Multipliers
14.9 Taylor’s Formula for Two Variables
14.10 Partial Derivatives with Constrained Variables

R16 Learning Objectives
▶ Derive the least squares equations to fit the plane $Ax + By + C$ to a set of given points (14.8).
▶ Calculate a cubic approximation to a function of two variables at a specified point (14.9).
▶ Apply the chain rule to compute partial derivatives with intermediate variables (14.10).

While We’re Waiting to Start
Let $L = f(U, V, S)$, and $S = 3UV$. Calculate or derive expressions for the following derivatives.

A) $\left(\frac{\partial S}{\partial V}\right)_U$

B) $\frac{dS}{dV}$

C) $\left(\frac{\partial L}{\partial V}\right)_U$

D) $\left(\frac{\partial L}{\partial V}\right)_{S,U}$
The Chain Rule with Intermediate Variables, Parts A and B

Let \( L = f(U, V, S) \), and \( S = 3UV \). Calculate or derive expressions for the following derivatives.

A) \( \left( \frac{\partial S}{\partial V} \right)_U \)  \hspace{2cm} B) \( \frac{dS}{dV} \)
The Chain Rule with Intermediate Variables, Parts C and D

Let $L = f(U, V, S)$, and $S = 3UV$. Calculate or derive expressions for the following derivatives.

C) $\left( \frac{\partial L}{\partial V} \right)_U$

D) $\left( \frac{\partial L}{\partial V} \right)_{S,U}$
Taylor Approximation (14.9)

Calculate the cubic approximation to \( f(x, y) = 4x \cos(y) \) near the origin. Complete this question in group work. \textit{Note: this was a pop quiz in 2014.}
Approximation Error (14.9)

Use your results from the previous problem to find the quadratic approximation to \( f(x, y) = 4x \cos(y) \) near the origin. Then estimate the error in the approximation if \(|x| < 0.5\) and \(|y| < 0.1\).
Least Squares (14.8)

The plane \( z = Ax + By + C \) is to be fitted to a given set of points, \((x_n, y_n, z_n)\). Derive the linear system of equations that, when solved, minimizes

\[
E = \sum_{n=1}^{N} (Ax_n + By_n + C - z_n)^2.
\]
Least Squares (continued)
Least Squares (continued)

15.2 Double Integrals over General Regions
15.3 Area by Double Integration

R17 Learning Objectives
- Construct a double integral that represents the area of a region bounded by a set of given curves in Cartesian coordinates.
- Change the order of integration of a double integral (Cartesian coordinates).

Today’s Questions
1. Sketch the region bounded by the given curves and construct a double integral that represents its area.
   a) \( y = \sqrt{x}, y = x^3 \).
   b) \( x = 5 - y, x = 2y - 1, y = 1 \).
   c) \( y = x - 6, y^2 = x \).
2. Change the order of integration for the following integrals.
   a) \( \int_{-1}^{0} \int_{-\sqrt{y+1}}^{\sqrt{y+1}} dxdy \)
   b) \( \int_{2}^{1+e} \int_{0}^{\ln(x-1)} f(x, y)dydx \)
GRA3, Next Tuesday (5 points)
Suppose we wanted to locate all the minimums and maximums of $x^2y^2$ subject to $(x^2 + y^2)^2 + xy^2 = 1$. Reduce this problem to the problem of solving three equations in three unknowns. Do not solve the equations you derive.

Quiz 3: One Week from Thursday
Quiz 3 may cover 14.8 to 14.10, and 15.1 to 15.4. We’ll see.

Wolfram Alpha Syntax for Double Integrals
You may want to use Wolfram Alpha to check your answers while completing your HW. Suppose that we want to determine the value of

$$\int_{-1}^{-2} \int_{0}^{x-1} (x^{2C} + y) dy dx$$

The syntax we could use to compute this particular integral is the following.

integrate $x^{2C}+y$, $x$ from $-2$ to $-1$ and $y$ from $0$ to $(x-1)$
1a) Area of a Region

Sketch the region bounded by $y = \sqrt{x}$, $y = x^3$ and construct a double integral that represents its area.
1b) Area of a Region

Sketch the region bounded by $x = 5 - y$, $x = 2y - 1$, $y = 1$, and construct a double integral that represents its area.
1c) Area of a Region

Sketch the region bounded by \( y = x - 6 \), \( y^2 = x \), and construct a double integral that represents its area.
2a) Changing the Order of Integration

2a) Change the order of integration for the following integral.

\[ \int_{-1}^{0} \int_{-\sqrt{y+1}}^{\sqrt{y+1}} \, dx \, dy \]
2a) Changing the Order of Integration (continued)
2b) Changing the Order of Integration

Change the order of integration for the following integral.

\[ \int_2^{1+e} \int_0^{\ln(x-1)} f(x, y) dy \, dx \]
3) Evaluating an Integral (if time permits)

Evaluate the following double integral.

\[ \int_0^4 \int_y^4 e^{x^2} \, dx \, dy \]
Recitation 18

R18 Topics
15.2 Double Integrals over General Regions
15.3 Area by Double Integration

R18 Learning Objectives
▶ Construct a double integral that represents the area of a region bounded by a set of given curves in Cartesian coordinates.
▶ Change the order of integration of a double integral.
▶ Calculate the average value of a function of two variables.

Today’s Questions
1. Change the order of integration.
   a) \[ \int_{-1}^{0} \int_{-\sqrt{y+1}}^{\sqrt{y+1}} dxdy \]
   b) \[ \int_{2}^{1+e} \int_{0}^{\ln(x-1)} f(x, y) dydx \]

2. Construct a double integral that represents the volume of the solid enclosed by the cylinder \( x^2 + y^2 = 1 \), the planes \( z = y \), \( x = 0 \), \( z = 0 \), in the first octant.

3. Evaluate \( \int_{0}^{4} \int_{y}^{4} e^{x^2} dxdy \).
Announcements

GRA3, Next Tuesday (5 points)
Suppose we wanted to locate all the minimums and maximums of $x^2 y^2$ subject to $(x^2 + y^2)^2 + xy^2 = 1$. Reduce this problem to the problem of solving three equations in three unknowns. Do not solve the equations you derive.

Quiz 3: Next Thursday
Quiz 3 may cover 14.8 to 14.10, and 15.1 to 15.4. We'll see.
The Average Value of a Function (15.3)

The average value of a function, \( f(x, y) \), over a region \( R \), is given by

\[
\text{Average value of } f \text{ over region } R = \frac{1}{\text{area of } R} \int \int_R f(x, y) dA
\]

This definition can be used to find the value of some double integrals quickly.

**Example**
Region \( R \) is the unit circle \( \sqrt{x^2 + y^2} \leq 1 \). The definite integral of \( f = x + 1 \) over \( R \) is equal to:

a) 0  

b) 1  

c) \( \pi \)  

d) \( \pi/4 \)
Conceptual Question Related to Double Integrals

Let region \( R \) be the square \(-1 \leq x \leq 1, -1 \leq y \leq 1\). The definite integral of \( x^3 \) over region \( R \) is equal to:

a) a positive number
b) a negative number
c) zero
d) a function of \( x \)
1a) Changing the Order of Integration

Change the order of integration.

\[ \int_{0}^{y+1} \int_{-\sqrt{y+1}}^{\sqrt{y+1}} \, dx \, dy \]
1a) Changing the Order of Integration (continued)
1b) Changing the Order of Integration

Change the order of integration.

$$\int_{2}^{1+e} \int_{0}^{\ln(x-1)} f(x, y) dy \, dx$$
2) Volume of a Solid

Construct a double integral that represents the volume of the solid enclosed by the cylinder $x^2 + y^2 = 1$, the planes $z = 1 - y$, $x = 0$, $z = 0$, in the first octant.
3) Evaluating a Double Integral

Evaluate the following double integral.

\[ \int_0^4 \int_y^4 e^{x^2} \, dx \, dy \]
**Additional Exercises**

1. Set up an integral that represents the volume of the solid enclosed by the planes \( x = 1, y = 3 \), the three coordinate planes, and \( x^2 + 2y^2 + z = 1 \).

2. Find the volume of the solid enclosed by \( z = x^2 + y^2 \), \( y = x^2 \) and \( x = y^2 \).

15.5 Triple Integrals in Rectangular Coordinates
15.6 Moments of Inertia and Mass

R23 Learning Objectives
▶ Construct a triple integral that represents the area of a region bounded by a set of given curves in Cartesian or cylindrical coordinates
▶ Change the order of integration of a triple integral
▶ Set-up integrals that represent moments of inertia and centres of mass of solids

Today’s Questions

1. Set-up a triple integral that represents the volume bounded by the following surfaces. Set-up the integrals in at least two different ways.
   1.1 $y^2 + z^2 = 1$, and the planes $y = x$, $x = 0$, and $z = 0$.
   1.2 $z^2 = y$, and the planes $y + z = 2$, $x = 0$, $x = 2$, and $z = 0$.

2. Consider the region inside the curve $r = 2 + \sin(\theta)$. Set up the three integrals you need to find the $x$ and $y$ coordinates of the centroid of the region, assuming its density is $\delta(x, y)$. Express these integrals in polar coordinates. This is a question from a 2014 quiz.
Instructions (same as before)

- Every student in your group needs to write their name or initials on the board.
- You have 15 minutes to answer both questions below.
- For full marks, show at least two intermediate steps.
- All students in the same group receive the same grade.
- Please do not share computers: every student should log in on their own computer.
- You do not need to simplify your answers.

Questions (5 points each, both questions are from old quizzes)

1. Set-up a triple integral that represents the volume of the ellipsoid $x^2 + (y/2)^2 + (z/9)^2 = 1$ in the 1st octant ($x, y, z$ non-negative). Do not evaluate.

2. Set-up a triple integral that represents the volume of the solid bounded by the hyperboloid of two sheets $-x^2 - y^2 + z^2 = 4$, the plane $z = 8$ and the plane $z = 10$. Do not evaluate.
Triple Integrals, Example 1

Set-up a triple integral that represents the volume of the region bounded by $y^2 + z^2 = 1$, and the planes $y = x$, $x = 0$, and $z = 0$. Set-up the integral in at least two different ways.
Triple Integrals, Example 1 (continued)
Triple Integrals, Example 2

Set-up a triple integral that represents the volume of the region bounded by \( z^2 = y \), and the planes \( y + z = 2 \), \( x = 0 \), \( x = 2 \), and \( z = 0 \). Set-up the integral in at least two different ways.
Centroid

Consider the region inside the curve \( r = 2 + \sin(\theta) \). Set up the three integrals you need to find the \( x \) and \( y \) coordinates of the centroid of the region, assuming its density is \( \delta(x, y) \). Express these integrals in polar coordinates. This is a question from a 2014 quiz.
Recitation 24

R24 Topics
15.7 Integration in Cylindrical and Spherical Coordinates

R24 Learning Objectives
▶ Construct a triple integral that represents the area of a region bounded by a set of given curves in cylindrical or spherical coordinates
▶ Change the order of integration of a triple integral

The Spherical Coordinate System

Fill in the blanks.

\[ x = \rho \cos \theta \] ____________

\[ y = \rho \sin \theta \] ____________

\[ z = \rho \] ____________
Instructions (same as before)

- Every student in your group needs to write their name or initials on the board.
- You have 15 minutes to answer both questions below.
- For full marks, show at least **two intermediate steps**.
- All students in the same group receive the same grade.
- Please do not share computers: every student should log in on their own computer.
- You do not need to simplify your answers.

Questions (5 points each, both questions are from old quizzes)

1. Set-up a triple integral that represents the volume of the ellipsoid
   \[ x^2 + \left(\frac{y}{2}\right)^2 + \left(\frac{z}{9}\right)^2 = 1 \]
   in the 1st octant \((x,y,z\) non-negative). Do not evaluate.

2. Set-up a triple integral that represents the volume of the solid bounded by
   the hyperboloid of two sheets \(-x^2 - y^2 + z^2 = 4\), the plane \(z = 8\) and the plane \(z = 10\). Do not evaluate.
Spherical Coordinates

Provide a geometric interpretation the surfaces \( \rho \sin \phi = 1 \) and \( \rho \cos \phi = 1 \).
1) A Triple Integral in Cylindrical Coordinates

Use cylindrical coordinates to set-up an integral that represents the volume of the solid bounded by $x^2 + y^2 + z^2 = 1$, and $z^2 = 3(x^2 + y^2)$. 
2) A Triple Integral in Spherical Coordinates

Use spherical coordinates to set-up an integral that represents the volume of the solid bounded by $z = 0$, $x^2 + y^2 = 4$, and $z = 2\sqrt{x^2 + y^2}$.
3) A Triple Integral in Spherical Coordinates

Use spherical coordinates to set-up an integral that represents the volume of the solid in the first octant, between the surfaces \( x^2 + y^2 = z^2 \) and 
\[
z = \sqrt{2 - (x^2 + y^2)}.
\]
4) Triple Integrals

Set-up a triple integral that represents the volume of the solid bounded by 
\[ z = x^2 + y^2, \] and the plane \( y = z \). Use cylindrical coordinates.
Recitation 25

Quiz 4 Topics
15.3 to 15.8

Quiz 4 Learning Objectives

- Construct a triple integral that represents the area or volume of a region in Cartesian, polar, cylindrical, or spherical coordinates
- Change the order of integration, or coordinate system, for a triple integral
- Construct integrals that represent moments of inertia and centres of mass
- Identify a suitable transformation for a triple integral, and use that transform to find the area or volume of a given region

GRA4

1. Set-up a triple integral that represents the volume of the ellipsoid \( x^2 + (y/2)^2 + (z/9)^2 = 1 \) in the 1st octant \((x,y,z \text{ non-negative})\). Do not evaluate.

2. Set-up a triple integral that represents the volume of the solid bounded by the hyperboloid of two sheets \(-x^2 - y^2 + z^2 = 4\), the plane \(z = 8\) and the plane \(z = 10\). Do not evaluate.
Graded Recitation Activity 4

Instructions (same as before)

- Every student in your group needs to write their name or initials on the board.
- You have 15 minutes to answer both questions below.
- For full marks, show at least two intermediate steps.
- All students in the same group receive the same grade.
- Please do not share computers: every student should log in on their own computer.
- You do not need to simplify your answers.

Questions (5 points each, both questions are from old quizzes)

1. Set-up a triple integral that represents the volume of the ellipsoid $x^2 + \left(\frac{y}{2}\right)^2 + \left(\frac{z}{9}\right)^2 = 1$ in the 1st octant ($x,y,z$ non-negative). Do not evaluate.

2. Set-up a triple integral that represents the volume of the solid bounded by the hyperboloid of two sheets $-x^2 - y^2 + z^2 = 4$, the plane $z = 8$ and the plane $z = 10$. Do not evaluate.
Set-up a triple integral that represents the volume of the ellipsoid 
\[ x^2 + \left(\frac{y}{2}\right)^2 + \left(\frac{z}{9}\right)^2 = 1 \] in the 1st octant \((x, y, z\) non-negative). Do not evaluate.
Set-up a triple integral that represents the volume of the solid bounded by the hyperboloid of two sheets $-x^2 - y^2 + z^2 = 4$, the plane $z = 8$ and the plane $z = 10$. Do not evaluate.
Change of Variables

- After completing HW 15.8, you might be familiar with computing an integral, if you are given a transform.
- But if we were given an integral over a complicated region, and were not given a suitable transform, how could we find one?
- The basic idea is to find a transform that converts a complicated region into a simple one, such as a square, or a circle
1) Change of Variables

Show that the area of the ellipse \((x/a)^2 + (y/b)^2 = 1\) is \(\pi ab\).
2) Change of Variables

Set-up an integral that represents the area of a region bounded by $x + y = 0$, $x + y = 1$, $x - y = 0$, $x - y = 2$. 
2) Change of Variables (continued)
3) Triple Integrals

Set-up a triple integral that represents the volume of the solid bounded by $0 \leq x \leq 1$, $0 \leq y \leq \sqrt{1 - x^2}$, and $\sqrt{x^2 + y^2} \leq z \leq \sqrt{2 - (x^2 + y^2)}$. 
4) Cylindrical

Set-up a triple integral that represents the volume of the solid bounded by $z = x^2 + y^2$, and the plane $y = z$. Use cylindrical coordinates.
5) Triple Integral

Set-up a triple integral that represents the volume of the solid bounded by
\[1 = x^2 + y^2, \text{ above } x^2 + y^2 + 4z^2 = 36, \text{ and below by } z = 1.\]
5) Triple Integral (Alternate Solution)

Set-up a triple integral that represents the volume of the solid bounded by
$1 = x^2 + y^2$, above $x^2 + y^2 + 4z^2 = 36$, and below by $z = 1$. 
Recitation 27

Today’s Topics
16.1 Line Integrals (brief review)
16.2 Vector Fields and Line Integrals, Work, Circulation, Flux

Learning Objectives
16.1 Set-up and evaluate a line integral to calculate the mass of a thin wire
16.2 Set-up and evaluate a line integral that represents total work
16.1: Mass of a Thin Wire (a review of lecture material?)

How To Calculate Mass of a Wire

• position on wire given by parameterization, $r(t)$
• density of wire is $\delta = \delta(r(t))$
• length of a small piece of wire is $\Delta s(r(t))$
• we can approximate the total mass with:

$$M \approx$$

In the limit as $\Delta s$ tends to zero,

$$M =$$

To compute total mass, we can show that:

$$M =$$
16.1: Mass of a Thin Wire

Compute the total mass of a wire whose density is given by $\delta = 3x^2 - 2y$, and whose shape is given by the line segment from the origin to the point (2,4).
16.2: Work (a review of lecture material?)

Work is the ______________ transferred to or from an object by means of a ______________ acting on the ______________.
16.2: Work Over a Straight Line Path

Force \( \mathbf{F} \) is applied to an object as it moves from \( x = a \) to \( x = b \) along the x-axis.

<table>
<thead>
<tr>
<th>Case 1</th>
<th>Applied Force</th>
<th>Work</th>
</tr>
</thead>
<tbody>
<tr>
<td>F = 4i</td>
<td>W =</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Case 2</th>
<th>Applied Force</th>
<th>Work</th>
</tr>
</thead>
<tbody>
<tr>
<td>F = 4i – 2j</td>
<td>W =</td>
<td></td>
</tr>
</tbody>
</table>

*we need to extend this concept to curved paths in \( \mathbb{R}^3 \)*
16.2: Force Over a Curved Path

Force $\mathbf{F}$ applied to an object as it moves from $\mathbf{r}(u)$ to $\mathbf{r}(u + h)$ along curve $\mathbf{C}$.

Work done by force $\mathbf{F}$ from $\mathbf{r}(u)$ to $\mathbf{r}(u+h)$ is $W(u + h) - W(u)$.

<table>
<thead>
<tr>
<th>Case 3</th>
<th>Applied Force</th>
<th>Work</th>
</tr>
</thead>
<tbody>
<tr>
<td>$F = F(r(u))$</td>
<td></td>
<td>$W(u + h) - W(u) \approx$</td>
</tr>
</tbody>
</table>
16.2: Calculating Work

Set up an integral that represents the total work.

a) \( \mathbf{F} = (x + 2y)i + (2x + y)j \), path is \( y = x^2 \) from (0,0) to (2,4).

b) \( \mathbf{F} = (x - y) \mathbf{i} - xy \mathbf{j} \), along the line from (2,3) to (1,2).

c) \( \mathbf{F} = xy \mathbf{i} - 2 \mathbf{j} + 4z \mathbf{k} \), along the circular helix \( \mathbf{r} = \cos(u) \mathbf{i} + \sin(u) \mathbf{j} + u \mathbf{k} \), from \( u = 0 \) to \( u = 2\pi \).
Recitation 28

Today’s Topics
16.2 Vector Fields and Line Integrals, Work, Circulation, Flux
16.3 Path Independence

Learning Objectives
16.2 Set-up, evaluate, and interpret integrals to calculate circulation and flux
16.3 Determine whether a vector field is conservative

Circulation
Circulation is a measure of the flow along a curve C, or net velocity along C.

circulation = \Gamma = \int_C \vec{v}(\vec{r}) \cdot d\vec{r} = \int_a^b \vec{v}(\vec{r}(t)) \cdot \vec{r}'(t) \, dt
16.2: Circulation

Sketch the velocity field for \( \mathbf{v} \), and calculate the circulation over curve \( C \), where \( C \) is the circle of radius \( R \).

\[
\mathbf{v} = \begin{cases} 
2\hat{i}, & R \leq y \leq R \\
0, & \text{else}
\end{cases}
\]

For part a), the circulation is _____ because ______________.

For part b), the circulation is _____ because ______________.
Application of Circulation

The circulation of a vector field $\mathbf{V}$ around a directed closed curve is

$$\text{circulation} = \Gamma = \oint_C \mathbf{v}(\mathbf{r}) \cdot d\mathbf{r}$$

- Note the cross-sectional profile of the wing
- Take $C$ to be a path around the wing, on its surface
- Upward lift force is proportional to circulation, $\Gamma$
16.2: An Application of Circulation

Take C to be a closed path around the wing on its surface

- Write $\Gamma$ as $\Gamma = \Gamma_{\text{upper}} + \Gamma_{\text{lower}}$
- $\Gamma_{\text{upper}}$ and $\Gamma_{\text{lower}}$ have opposite signs
- the magnitude of $\mathbf{V}$ along the upper surface of the wing is greater than along the lower surface: net circulation is non-zero
16.2: Flux Across a Closed Plane Curve

Suppose we have a curve $C$ in the $xy$ plane, and a flow field $\mathbf{v} = M(x,y)\mathbf{i} + N(x,y)\mathbf{k}$. We want to measure the net flow through $C$.

\[
\text{flux} = \oint_C \mathbf{v} \cdot \mathbf{N} \, dt = \oint_C M \, dy - N \, dx
\]

- $k$ is the unit vector parallel to the $z$-axis
- $T$ is the tangent vector
- $N$ is the outward pointing unit normal vector of $C$

Note that:
- for a clockwise motion, we would instead use $k \times T$
- later on, we will make a connection between flux and Green’s theorem
Calculate the flux over curve C, where C is the circle of radius R.

\[ \vec{v} = \begin{cases} 2\hat{i}, & R \leq y \leq R \\ 0, & \text{else} \end{cases} \]

Therefore: the flux is ______ because __________________.
16.2: Circulation and Flux

1) Sketch the velocity field for \( \mathbf{v} = -\mathbf{i} - \mathbf{j} \), and calculate the circulation and flux over curve \( C \), where \( C \) is the circle of radius \( R \).

Therefore: the circulation is _____ because ______________.

Therefore: the flux is _____ because ______________.
2) Sketch the velocity field for \( \mathbf{v} = -y\mathbf{i} + x\mathbf{j} \), and calculate the circulation and flux over curve \( \mathbf{C} \), where \( \mathbf{C} \) is the circle of radius \( R \).
16.3: Conservative Vector Fields

Recall the Pipe example.

a) Why was the circulation zero?

b) For any path that starts and ends at point A, and stays inside “the pipe”, the circulation is ______________ .

c) For all paths that starts at A and ends at point B, the integral ______________ is the same.

In general: if \( \mathbf{v} \) is a conservative vector field (or is path independent), then there exists a scalar field, \( S \), s.t. __________ .
Recitation 29

Today's Topics
16.2 Vector Fields and Line Integrals, Work, Circulation, Flux
16.3 Path Independence

Learning Objectives
16.2 Set-up, evaluate, and interpret integrals to calculate circulation and flux
16.3 Determine whether a vector field is conservative and apply the FTLI

Circulation and Flux
Circulation is a measure of _______________

Flux is a measure of _______________

circulation = \Gamma = \int_C \vec{v}(\vec{r}) \cdot d\vec{r} = \int_a^b \vec{v}(\vec{r}(t)) \cdot \vec{r}'(t) \, dt

\text{flux} = \oint_C \vec{v} \cdot \vec{N} \, dt = \oint_C M \, dy - N \, dx
1) Sketch the velocity field for $v = -xi - yj$, and calculate the circulation and flux over curve C, where C is the circle of radius R.

Therefore: the circulation is ______ because ______________.

Therefore: the flux is ______ because ______________.
16.3: Conservative Vector Fields

In general: if $\mathbf{F}$ is a conservative vector field (or is path independent), then there exists a scalar field, $f$, s.t. $\square$, and

**Example:** Calculate total work from the force $\mathbf{F} = (x^2-y)i + (y^2-x)j$, over the path $\mathbf{r} = a \cos(t)i + b \sin(t)j$, where $0 \leq t \leq 2\pi$. 
16.3: Conservative Fields

Group work activity: determine whether the following fields are conservative

1) \( \mathbf{v} = -x \mathbf{i} - y \mathbf{j} \)
2) \( \mathbf{v} = -y \mathbf{i} + x \mathbf{j} \)
16.2: Circulation and Flux

Group work activity: sketch the velocity field for $v = -y\mathbf{i} + x\mathbf{j}$, and calculate the circulation and flux over curve C, where C is the circle of radius R.
Conclusions

a) Circulation measures flow ________________ path C.

b) Flux measures the flow ________________ of C.

c) If a flow is conservative, the line integral ______ is the same for any path C.

<table>

Recitation 30

Today's Topics
16.4 Green's Theorem
16.5 Surfaces and Areas

Learning Objectives
16.4 Apply Green's theorem to calculate area, flux, and circulation
16.5 Calculate the area of a surface given explicitly, implicitly, or parametrically

Green's Theorem
If R is a region that is _______________________________, and M and N are scalar fields that are differentiable on R, and C is the boundary of R, then:

\[ \text{flux} = \]

\[ \text{circulation} = \]
Green’s Theorem Example (from an old quiz)

Below are five regions. For which regions can we apply Green’s Theorem?

a)  

b)  

c)  

d)  

e)  

Green’s Theorem Example (from an old quiz)

Find the circulation AND flux for the field \( \mathbf{F} = 3x^2y^2 \mathbf{i} + 2x^3y \mathbf{j} \) around the rectangle \( 0 \leq x \leq 2, \ 0 \leq y \leq 3 \). Use Green's Theorem.
Green’s Theorem Example (from an old quiz)

Let \( R \) be the region in the plane, inside the cardioid \( r = 1 + \cos(\theta) \), and \( C \) its boundary. Consider the line integral

\[
\int_C xy \, dx - xy^2 \, dy.
\]

Use Green's theorem to convert to a double integral, and express this as a double integral in polar coordinates with limits.
The curve traced by a point on a rolling wheel is

\[ x(t) = t - \sin(t) \]
\[ y(t) = 1 - \cos(t) \]
Additional Example: Green’s Theorem

Find the area under one arch of the cycloid: 
\[ x(t) = t - \sin(t), \quad y(t) = 1 - \cos(t) \]
Additional Example: Green’s Theorem

a) Evaluate $\int_C y^2 \, dx + 2xy \, dy$, $C$ is one loop of $r = 2\sin 2\theta$

b) Change the integral so that it represents the area of one loop.
Surface area for a parameterized surface:

Your textbook has formulas for calculating the surface area for **implicit** and **explicit** surfaces, we probably won’t have time to work on these in recitation.
16.5 Surfaces and Areas

a) What properties does a parametric representation of a surface need to have?

b) Find a parametric representation for the part of the plane $z = x + 2$ in the first octant and inside the cylinder $x^2 + y^2 = 1$. 
Recitation 31

Today's Topics
16.5 Surfaces and Areas
16.6 Surface Integrals

Learning Objectives
16.5 Calculate the area of a surface given explicitly, implicitly, or parametrically
16.6 Calculate outward flux through a surface
16.6 Calculate the total mass and centroid of a thin surface (if time permits)

Course Logistics
1. Has a final exemption cutoff been announced?
2. What is the cutoff?
3. When is your final exam?
16.5 Surfaces and Areas

Surface area for a parameterized surface:

Your textbook has formulas for calculating the surface area for \textit{implicit} and \textit{explicit} surfaces, we probably won’t have time to work on these in recitation.
Set up an integral that represents the surface area of $z = y^2$, for $0 \leq x \leq a$, $0 \leq y \leq b$. 

16.5 Surface Area Example
16.5 Surface Area Example

Calculate the surface area of the part of the plane $x + 2y + z = 4$ that is inside the cylinder $x^2 + y^2 = 4$. 
Suppose we want to characterize 3D flow through a pipe.

To calculate 2D flux across a curve, we used:

\[ \text{flux} = \oint \vec{v} \cdot \vec{n} \, du = \int_c M \, dy - N \, dx \]

If our flow field, \( \mathbf{v} \), is 3D, we calculate flux across a surface.
A fluid has velocity field $\mathbf{v} = y\mathbf{i} + j + z\mathbf{k}$. Set up an integral that represents the flux through the paraboloid $z = 9 - (x^2 + y^2)/4$, if $x^2 + y^2 \leq 36$. 

16.6 Flux Through a Surface
Set up a double integral that represents the flux of flow $\mathbf{F} = xi + zk$ through the surface $z(x,y) = x^2 - y^2$, where $0 \leq x \leq 1$, $-1 \leq y \leq 1$. 

16.6 Surface Integrals (this was a 2014 pop quiz question)
16.6 Centroid of a Thin Surface (if time permits)

The mass density at any point on a thin surface $z^2 = x^2 + y^2$, $0 \leq z \leq 1$, is proportional to its distance to the $z$-axis.

a) Find the total mass of the surface.
b) Find the centroid of the surface.
16.5 Surface Area Parameterization (additional example)

Find parametric representations for the following surfaces.

a) the upper half of $4x^2 + 9y^2 + z^2 = 36$

b) the part of the plane $z = x + 2$ inside the cylinder of $x^2 + y^2 = 1$
Recitation 32

Today's Topics
Final Exam Review
16.7 Stokes Theorem
16.8 The Divergence Theorem

Learning Objectives
16.7 Use Stoke’s theorem to calculate either work, or circulation over a curve
16.8 Calculate flux through a surface using the divergence theorem

Final Exam Logistics
Review session: information sent via email
Questions during final: information sent via email
Studying for the Final Exam

There are two prep-finals available on T^2. Each of them have five questions that focus on specific areas of our textbook.

<table>
<thead>
<tr>
<th></th>
<th>Chapter 13</th>
<th>Chapter 14</th>
<th>Chapter 15</th>
<th>Chapter 16</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prep-Final A</td>
<td>P1</td>
<td></td>
<td></td>
<td>P2, P3, P4, P5</td>
</tr>
<tr>
<td>Prep-Final B</td>
<td>P1</td>
<td>P2</td>
<td>P3</td>
<td>P4, P5</td>
</tr>
</tbody>
</table>

Ways you may want to study:
- solve prep final questions
- re-do quizzes 1 through 4
- re-do MML problems
- memorize formulas (especially from Chapters 13 and 16)
PrepFinal Question A1

Find the speed, the tangential acceleration and the normal acceleration for the motion \( \mathbf{r} = (t,t^2,t^2) \). Compute also the curvature of the corresponding curve as a function of \( t \).
PrepFinal Question A2

Find the moment of inertia with respect to the x axis of a thin shell of mass $\delta$ that is in the first quadrant of the xy plane and bounded by the curve $r^2 = \sin 2\theta$. 
PrepFinal Question A3

Compute the center of mass of a thin shell that is formed by the cone 
\((z - 2)^2 = x^2 + y^2, \ 0 \leq z \leq 2\).
PrepFinal Question A4

Compute the line integral of the vector field $\mathbf{F} = (xyz + 1, x^2z, x^2y)e^{xyz}$ along the curve $\mathbf{r}(t) = (\cos t, \sin t, t)$, $0 \leq t \leq \pi$. 
Use the divergence theorem to compute the outward flux of the vector field \( \mathbf{F} = (x^2, y^2, z^2) \) through the cylindrical can that is bounded on the side by \( x^2 + y^2 = 4 \), bounded above by \( z = 1 \) and below by \( z = 0 \).
PrepFinal Question B1

Find the parametric equations of the line that is tangent to the curve \( r(t) = (e^t, \sin t, \ln(1 - t)) \), at \( t = 0 \).
PrepFinal Question B2

Find the minimum cost area of a rectangular solid with volume 64 cubic inches, given that the top and sides cost 4 cents per square inch and the bottom costs 7 cents per square inch. Just set up the equations using Lagrange multipliers, you do not have to solve them.
PrepFinal Question B3

Compute the average of the function $x^4$ over the sphere centered at the origin whose radius is $R > 0$. 
PrepFinal Question B4

Compute the flux \( \int_S \mathbf{F} \cdot \mathbf{n} \, d\sigma \), where \( S \) is the hemisphere \( x^2 + y^2 + z^2 = 4 \), \( z \geq 0 \), \( \mathbf{n} \) points toward the origin and \( \mathbf{F} = (x(z-y), y(x-z), z(y-x)) \).
PrepFinal Question B5

Compute the line integral \( \int_C \mathbf{F} \cdot d\mathbf{r} \) where \( C \) is the curve given by the intersection of the sphere \( x^2 + y^2 + z^2 = 4 \) and the plane \( z = -y \), counterclockwise when viewed from above, and \( \mathbf{F} = (x^2 + y, x + y, 4y^2 - z) \).
16.7 Stokes’ Theorem

Curl describes the tendency a fluid has to __________________ at a specific point. Stokes’ Theorem states that:

Note that curve C must be ____________

Stokes’ theorem can be used to calculate ____________ and ________ .

Historical note: Stokes’ theorem is named after Sir George Stokes, but was discovered by Sir William Thomson.
16.8 What is Divergence?

Divergence describes the tendency a fluid has to ______________.

Water is (approximately) an incompressible fluid. If you place your thumb at the end of a hose, the speed of the water ______________, because ______________, or because ______________.
16.8 The Divergence Theorem

The divergence theorem states that
16.8 The Divergence Theorem: Archimedes Principle

Upward buoyant force =
16.8 Prove Archimedes Principle
16.8 Electric Charge

\( \mathbf{E} = \text{electric field. Then, Gauss’ s Law states that:} \)

\[
\text{total charge} = (\varepsilon_0) (\text{flux of } \mathbf{E} \text{ through closed surface })
\]

Find the total charge contained in a solid hemisphere if \( \mathbf{E} = \mathbf{x}i + \mathbf{y}j + \mathbf{z}k. \)
Recitation 01: Welcome Back!

Today: Course and Recitation Organization, **Velocity and Acceleration** (12.6)
Thursday: Quadratic Surfaces (12.6)

**Start-of-Term Survey**
Please fill out if you haven’t already:

**Graded Recitation Activities This Semester**
- details sent via email
- group work, in Adobe Connect, count towards your pop quiz grade

**WebEx and Adobe Connect**
1. WebEx for first two weeks
2. online survey to determine if we want to continue using WebEx
3. Adobe Connect for graded group work activities and pop quizzes

**Other Announcements**
- Piazza is set-up, link in T-Square
- Tegrity is set-up, can view yesterday’s lecture
- Two MML HWs set-up, due Monday
Objectives
Throughout this course we find parametric representations of motion and use them to characterize motions.

Today's Learning Objectives
Characterize the two (or three) dimensional motion of an object, in parametric form, in terms of its
- velocity and acceleration
- tangent vector

Later in this course we'll look at curvature, path length, momentum, and other ways of describing a motion.

I'm assuming you've seen parametric representation of curves in lecture.
Find a parametric representation of the counterclockwise motion that travels along the curve $4x^2 + 9y^2 = 36$.  

**WANT:** $\mathbf{r}(t) = x(t) \mathbf{i} + y(t) \mathbf{j}$

1) **SKETCH CURVE**

2) **LET** 
   
   $x = x(t) = 3 \cos t$  
   $y = y(t) = 2 \sin t$ 

   because this choice satisfies $\star$ for all $t$.

   $\Rightarrow \mathbf{r}(t) = x(t) \mathbf{i} + y(t) \mathbf{j} = 3 \cos t \mathbf{i} + 2 \sin t \mathbf{j}$

   **But is motion counterclockwise?** Check:

   Motion "STARTS" AT $t = 0$, $x(0) = 3$  
   $y(0) = 0$  

   When $t = \frac{\pi}{2}$, $x(\frac{\pi}{2}) = 0$  
   $y(\frac{\pi}{2}) = 2$  

   **t = 0**
Position, Velocity and Acceleration

The position of an object is given by the curve \( r(t) = \sin(t)i + \cos(t)j \), for all \( t \).

a) Sketch the curve.

b) When are the position and velocity vectors perpendicular?

c) When do the position and acceleration vectors have the same direction?

d) Calculate the unit tangent vector for all \( t \).

\( r(t) = \sin(t)i + \cos(t)j \), and \( x^2 + y^2 = \cos^2 t + \sin^2 t = 1 \), so \( R \) traces a circle (clockwise ?)

\( r'(t) = \cos i - \sin j \)

\( 0 = \vec{r} \cdot r' = (\sin \theta \cos \theta + \cos \theta \sin \theta) \cdot (\cos \theta - \sin \theta) = 0 \Rightarrow \) perpendicular at \( t \).

\( \Rightarrow \) for circular motion, \( \vec{r} \perp \vec{r}' \) at \( t \).

\( r'' = -\vec{r} \), so anti-parallel at \( t \), so never in same direction.

\( \vec{T} = \frac{\vec{v}}{||\vec{v}||} = \frac{\vec{r}}{r} = \cos i - \sin j \)
Position and Velocity

The position of a particle is given by \( r(t) \). Describe situations where the following is true for all values of \( t \).

\[
\ddot{r}(t) \cdot \frac{d\dot{r}}{dt} = 0
\]

1) CIRCULAR MOTION

2) STATIONARY OBJECT (so that \( \ddot{r}(t) = 0 \))
Parametric Vector Representation

Find a parametric vector representation, \( \mathbf{r}(t) \), of the curve that satisfies the following equations, and \( y \) increases when \( x \) is positive.

\[
z = \sqrt{x^2 + y^2}, \quad y = x
\]

We want functions \( x(t), y(t), z(t) \) that satisfy \( \bigcirc \).

Try: \( x = t \), so \( y = x = t \), \( z = \sqrt{t^2 + t^2} = \sqrt{2} |t| \).

\[
\mathbf{r} = \begin{bmatrix} t \\ t \\ \sqrt{2}|t| \end{bmatrix}
\]

The path \( \mathbf{r}(t) \) is the intersection of plane \( y = x \) and cone \( z = \sqrt{x^2 + y^2} \).
Parametric Vector Representation

Find a parametric vector representation, \( r(t) \), of the curve that satisfies the following equations, and \( z \) decreases when \( x \) is positive. Sketch the motion.

\[
z = \sqrt{4 - x^2 - y^2}, \quad y^2 + x^2 - 2y = 0
\]

We want \( x(t), y(t), z(t) \) that satisfy given equations, (1) and (2)

Complete the square:
\[
x^2 + y^2 - 2y + 1 - 1 = 0
\]
\[
x^2 + (y-1)^2 = 1
\]
\[
\Rightarrow x = \cos t, \quad y = \sin t + 1 \quad \text{then (2) is satisfied}
\]

\[
z = \sqrt{4 - c^2 - (1+s)^2} = \sqrt{2 - 2\sin^2 t} \quad \Rightarrow
\]

\[
\begin{pmatrix}
\cos t \\
\sin t + 1 \\
\sqrt{2 - 2\sin^2 t}
\end{pmatrix}
\]

Curve is intersection of \( x^2 + y^2 + z^2 = 4 \) and \( x^2 + (y-1)^2 = 1 \)
Recitation 02

Today: Vector Representations of Curves (13.1), Quadratic Surfaces (12.6)

Start-of-Term Survey
Please fill out if you haven’t already:

Last Recitation
• Find parametric representations of given curves
• Characterize motion of an object, in parametric form, in terms of its
  o velocity and acceleration
  o unit tangent vector

Today
• Identify and sketch quadratic surfaces given their algebraic equations

While Waiting to Start: Sketch and describe the surface $5x^2 + 2y^2 - z^2 = -10$. 
Quadratic Surfaces (12.6)

Sketch and describe the surface $5x^2 + 2y^2 - z^2 = -10$.

In the $xy$-plane, $z=0$, $5x^2 + 2y^2 = -10$ is inconsistent! So surface does not intersect $xy$-plane.

In the $xz$-plane, $y=0$, $5x^2 - z^2 = -10$ is a hyperbola.

In the $yz$-plane, $x=0$, $2y^2 - z^2 = -10$, hyperbola.

Note: we could also consider level curves.
Quadratic Surfaces (12.6)

Sketch and describe the surface $5x^2 + 2y^2 - z^2 = -10$.

WolframAlpha

Input interpretation:

plot $5x^2 + 2y^2 - 6z^2 = -10$

Surface plot:

Geometric figure:

two-sheeted hyperboloid
Quadratic Surfaces

The textbook should list and describe every quadratic surface that you need to be familiar with (but the online textbook currently doesn’t work). Wikipedia also has a page that lists and describes every possible quadratic surface (for our course): http://en.wikipedia.org/wiki/Quadric

Below are four surfaces:

Ellipsoid
\[ \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \]

Hyperbolic paraboloid
\[ \frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 0 \]

Elliptic paraboloid
\[ \frac{x^2}{a^2} + \frac{y^2}{b^2} - z = 0 \]

Elliptic hyperboloid of one sheet
\[ \frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1 \]
Quadratic Surfaces

Identify the correct answer.

The set of all points whose distance from the z-axis is 4 is the:

a) sphere of radius 4 centered on the z-axis
b) line parallel to the z-axis 4 units away from the origin
\(\square\) cylinder of radius 4 centered on the z-axis
d) plane \(z = 4\)

\(\square\) is the set of all points whose distance from origin is 4
\(\square\) is a subset of points \(z\) axis is 4
d) is set of points \(xy\) plane is 4
Parametric Vector Representation and Quadratic Surfaces

Find a parametric vector representation of the curve, \( r(t) \), that satisfies both quadratic surfaces. Sketch \( r(t) \) and both surfaces.

\[ z = x^2 + y^2, \quad 5 = x^2 + y^2 \]

We need \( \vec{r} = x(t)\hat{i} + y(t)\hat{j} \) that satisfies both surfaces.

Try: \( x(t) = \sqrt{5} \cos t \), \( y(t) = \sqrt{5} \sin t \)

Then \( z(t) \) must be 5.

\[ \Rightarrow \vec{r}(t) = \begin{bmatrix} \sqrt{5} \cos t \\ \sqrt{5} \sin t \\ 5 \end{bmatrix} \]

Note: Can also choose \( x(t) = \sqrt{5} \sin t \), \( y(t) = -\sqrt{5} \cos t \)
Quadratic Surfaces (12.6)

Consider the surface \( z = Ax^2 + By^2 \), where \( A \) and \( B \) are constants. Identify all possible surfaces for the following cases.

i) \[ A = B = 0 \]

ii) \[ AB > 0 \]

iii) \[ AB < 0 \]

(c) \( z = 0 + 0 = 0 \) \( \Rightarrow \) \( xy \)-plane.

ii) \( A \& B \) positive: \( z \) must be positive
(elliptic paraboloid)

\( A \& B \) negative: \( z \) must be negative

(Why does it look like this?
Fix \( z \): if \( z = 1 \): \( z = Ax^2 + By^2 \)

elliptical cone)
**Parametric Vector Representation and Quadratic Surfaces**

The following surfaces intersect along a curve. Find a) the projection of the curve onto the xy-plane and b) its parametric vector representation.

\[ z = x^2 + y^2, \quad z = 2y + 3 \]

**Curve P is the set of points** \((x, y, 0)\) such that

\[ x^2 + y^2 = 2y + 3 \]
\[ x^2 + y^2 - 2y = 3 \]
\[ x^2 + y^2 - 2y + 1 - 1 = 3 \]
\[ x^2 + (y - 1)^2 = 4 \]

\(\Rightarrow\) **P is the circle, radius 2, centre** \((0, 1)\)

\(\Rightarrow\) let \(x(t) = 2 \cos t, \quad y(t) = (1 + 2 \sin t)\)

\(\Rightarrow\) **Parameterization of P**
Recitation 03

Today: Group Work on Vector Representations of Curves, Quadratic Surfaces

Hello from San Antonio! Your instructor and I are at a large annual math conference. I hope the wifi is going to hold up for our recitation this morning, many apologies if it doesn’t. In case you’re interested, this the conference website: http://jointmathematicsmeetings.org/jmm

Textbook: technical issues should be resolved now

Start-of-Term Survey
Please fill out if you haven’t already (survey closes Wednesday at midnight):

Today: Quadractic Surfaces and Parametric Vectors
• Find parametric representations of given curves
• Characterize motion of an object, in parametric form, in terms of its velocity and acceleration, unit tangent vector
• Identify and sketch quadratic surfaces given their algebraic equations
Group Work Questions

Complete each problem in small groups. The first four questions are from old Math 2401 quizzes (2013 and 2014).

1) Consider the twisted cubic \( r(t) = ti + t^2j + t^3k \) and the plane \( x + 2y + 3z = 34 \).
   a) Where does the cubic intersect the plane?
   b) Find the cosine of the tangent to the curve and the normal to the plane.

2) Find the intersection of the surface \( x^2 + 2y^2 = z \) and the plane \( x - y = 5 \). A parameterization would be fine.

3) Consider the surface \( x^2 - 6x + 4y + y^2 + 8z - z^2 = 4 \).
   a) Find the center of the surface.
   b) Name the surface.
   c) Draw a picture of the surface, labelling the center and axes.

4) Consider the surface \( 9x^2 - 18x - 16y + 4y^2 - 4z^2 = 11 \).
   a) Find the center of the surface.
   b) Name the surface.
   c) Draw a picture of the surface, labelling the center and axes.

5) How do the surfaces in questions 3 and 4 compare? How are they different?

6) Create a vector function, \( r(t) \), on the interval \([0, 2\pi]\), that satisfies the conditions \( r(0) = ai \), and as \( t \) increases from 0 to \( 2\pi \), traces out an ellipse \( b^2x^2 + a^2y^2 = a^2b^2 \), twice in a counterclockwise manner.
1) Consider the twisted cubic $\vec{r}(t) = ti + t^2j + t^3k$ and the plane $x + 2y + 3z = 34$.
   
   a) Where does the cubic intersect the plane?
   
   b) Find the cosine of the tangent to the curve and the normal to the plane.

   a) By definition, the plane is the set of all points s.t. $x + 2y + 3z = 34$.
   
   The vector $\vec{r}(t)$ is the curve $\vec{F} = x(t)i + y(t)j + z(t)k$.
   
   For some value(s) of $t$, $\vec{F}(t)$ will intersect the plane.
   
   For a point on the curve to be in the plane, it must satisfy:
   
   $x(t) + 2y(t) + 3z(t) = 34$
   
   $t + 2(t^2) + 3(t^3) = 34$

   Guess & check: $t = 2$ works ($2 + 2(4) + 3(8) = 34$). So the cubic poly can be written as

   $(t - 2)(3t^2 + 8t + 17) = 0$ FROM REM

   complex roots

   $t = 2$ is only intersection, and this is the point $(2, 2^2, 2^3)$.

   b) $\cos \theta = \frac{\vec{F}'(2) \cdot \vec{N}}{||\vec{F}'(2)|| \cdot ||\vec{N}||}$

   $\vec{F}' = \left[ \begin{array}{c} 1 \\ 4 \\ 8 \end{array} \right]$, $\vec{N} = \left[ \begin{array}{c} 1 \\ 2 \\ 3 \end{array} \right]$.
2) Find the intersection of the surface $x^2 + 2y^2 = z$ and the plane $x - y = 5$. A parameterization would be fine.

A parameterization of the plane is

$$
\begin{align*}
    x &= t \\
    y &= x - 5 = t - 5 \\
    z &= \text{constant}
\end{align*}
$$

Parameterization of intersection is

$$
\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k} = 
\begin{bmatrix}
    x(t) \\
    y(t) \\
    z(t)
\end{bmatrix}
$$

For $z(t)$ use equation of surface $z(t) = x^2 + 2y^2$

$$
= t^2 + 2(t-5)^2 \\
= 3t^2 - 20t + 50
$$

$$
\mathbf{r}(t) = 
\begin{bmatrix}
    t \\
    t-5 \\
    3t^2 - 20t + 50
\end{bmatrix}
$$
3) Consider the surface \( x^2 - 6x + 4y + y^2 + 8z - z^2 = 4 \).

a) Find the center of the surface.

b) Name the surface.

c) Draw a picture of the surface, labelling the center and axes.

First put surface equation into standard form:

\[
(x^2 - 6x + 9 - 9) + (y^2 + 4y + 4 - 4) - (z^2 - 8z + 16 - 16) = 4
\]

\[
(x - 3)^2 - 9 + (y + 2)^2 - 4 - (z - 4)^2 + 16 = 4
\]

\[
(x - 3)^2 + (y + 2)^2 - (z - 4)^2 = 1
\]

a) Centre is at \((3, -2, 4)\).

b) By inspection, the surface is a hyperbolic paraboloid of 1 sheet.
4) Consider the surface $9x^2 - 18x - 16y + 4y^2 - 4z^2 = 11$.
   
   a) Find the center of the surface.
   
   b) Name the surface.
   
   c) Draw a picture of the surface, labelling the center and axes.

Express in standard form:

\[ 9(x^2 - 2x + 1 - 1) + 4(y^2 - 4y + 4 - 4) - 4z^2 = 11 \]

\[ 9(x-1)^2 + 4(y-2)^2 - 4z^2 = 11 + 9 + 16 = 36 \]

\[ \frac{(x-1)^2}{4} + \frac{(y-2)^2}{9} - \frac{z^2}{9} = 1 \]

a) Centre is located at the point $(1, 2, 0)$.

b) Surface is a one-sheet hyperboloid.
6) Create a vector function, \( \mathbf{r}(t) \), on the interval \([0, 2\pi]\), that satisfies the conditions \( \mathbf{r}(0) = a \mathbf{i} \), and as \( t \) increases from 0 to \( 2\pi \), traces out an ellipse \( b^2 x^2 + a^2 y^2 = a^2 b^2 \), twice in a counterclockwise manner.

We need an \( \mathbf{r}(t) \) that satisfies

\[
\begin{align*}
\frac{b^2}{a^2} x^2 + a^2 y^2 &= a^2 b^2, \\
\end{align*}
\]

We can try:

\[
\begin{align*}
x(t) &= a \cos t \\
y(t) &= b \sin t \\
\end{align*}
\]

Does this satisfy \( \bigcirc \)? Let's see:

\[
\begin{align*}
b^2(a \cos t)^2 + a^2(b \sin t)^2 &= a^2 b^2, \\
\end{align*}
\]

Equation \( \bigcirc \) satisfied. However, does

\[
\mathbf{r}(t) = \begin{bmatrix} a \cos t \\ b \sin t \end{bmatrix}
\]

trace out an ellipse twice in a counterclockwise manner on \([0, 2\pi]\)?

No. But this does:

\[
\begin{align*}
x(t) &= a \cos(2t) \\
y(t) &= b \sin(2t)
\end{align*}
\]
Recitation 04

Today: Displacement, Velocity, Acceleration (13.2), Path Length (13.3)

**Homework:** Due Tonight and Monday

**Learning Objectives for Today:** Characterize motion of an object, in parametric form, in terms of its unit tangent vector, acceleration, path length (aka arc length).

![Photo by Wikimedia Commons user Kreuzschnabel](image-url)
2. **Particle Motion**

Let \( \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k} \).

a) How is the unit tangent vector, \( \mathbf{T}(t) \), defined mathematically?

b) Suppose \( x = t^2 \), \( y = t^3 \), \( z = t^2 \), and \( t \) is any real number. Then what is the unit tangent vector when \( t = 0 \)?

\[
\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} = \frac{\mathbf{r}'(t)}{\sqrt{(2t)^2 + (3t^2)^2 + (2t)^2}} = \frac{\mathbf{r}'(t)}{\sqrt{8t^2 + 9t^4}}
\]

\[
\mathbf{T}(t) = \frac{2t\mathbf{i} + 3t^2\mathbf{j} + 2t\mathbf{k}}{\sqrt{8t^2 + 9t^4}} \quad \text{(leave as is to see if students point out that we can factor)}
\]

\[
\Rightarrow \mathbf{T}(0) = 0 \quad \text{uh-oh! What does this mean? What can we do?}
\]

1) l'Hôpital works but is messy
2) factoring/simplifying is easier: \( \mathbf{T} = \frac{2\mathbf{i} + 3t\mathbf{j} + 2t\mathbf{k}}{\sqrt{8 + 9t^4}} \)

\[
\Rightarrow \mathbf{T}(0) = \frac{2\mathbf{i} + 3(0)\mathbf{j} + 2\mathbf{k}}{\sqrt{8 + 0}} = \frac{1}{2\sqrt{2}} \begin{bmatrix} 2 \\ 0 \\ 2 \end{bmatrix}
\]

\( \Rightarrow \text{Sometimes need to simplify along the way} \)
Differential Equation

3 Solve the following initial value problem.

\[ \ddot{\vec{F}}(t) = m \dddot{\vec{r}}(t) = t\hat{i} + t^2 \hat{j}, \quad \vec{r}(0) = \hat{i}, \quad \vec{v}(0) = \hat{k}. \]

Q) what are we trying to find? A) \( \vec{r}(t) \).

\[ \vec{r} = \int \vec{r}''(t) \, dt \]

\[ = \int \begin{bmatrix} t \\ \frac{t^2}{2} \\ \frac{t^3}{3} \end{bmatrix} \, dt \]

[get students to tell you that this is needed]

\[ = \begin{bmatrix} \frac{t^2}{2} + c_1 \\ \frac{t^3}{3} + c_2 \\ c_3 \end{bmatrix} \]

[students can tell you what these are]

but \( \vec{v}(0) = \hat{k} \), so \( c_1 = c_2 = 0 \), \( c_3 = 1 \)

\[ \Rightarrow \vec{v} = \begin{bmatrix} \frac{t^2}{2} \\ \frac{t^3}{3} \\ 1 \end{bmatrix} \]

\[ \Rightarrow \vec{r} = \int \begin{bmatrix} \frac{t^3}{6} + d_1 \\ \frac{t^4}{12} + d_2 \\ t + d_3 \end{bmatrix}, \quad d_1 = 1, \quad d_2 = d_3 = 0. \quad \Rightarrow \vec{r}(t) = \begin{bmatrix} \frac{t^3}{6} + 1 \\ \frac{t^4}{12} \\ t \end{bmatrix} \]
**Velocity and Acceleration**

What constant acceleration must a particle experience if it is to travel from (1,2,3) to (4,5,7) along the straight line joining the points, starting from rest, and covering the distance in 2 units of time?

**Q:** How can we start?

**A:** We need an \( F(t) \), which should be a straight line.

\[
\text{Acceleration, } \vec{a} = \begin{bmatrix} \dot{c}_1 \\ \dot{c}_2 \\ \dot{c}_3 \end{bmatrix} \text{. We want } c_1, c_2, c_3 \\
\Rightarrow \vec{v} = \begin{bmatrix} c_1 t + d_1 \\ c_2 t + d_2 \\ c_3 t + d_3 \end{bmatrix} = \vec{C} + \vec{D}
\]

But \( \vec{F}(0) = 0 \), so \( d_1 = d_2 = d_3 = 0 \).

\[
\vec{v} = C + \vec{D}, \quad \vec{r} = \frac{C}{2} t^2 + \begin{bmatrix} \frac{1}{2} \\ \frac{1}{3} \end{bmatrix}, \quad \vec{r}(0) = \begin{bmatrix} 1 \\ 3 \end{bmatrix}, \text{ so } \frac{C}{2} = \frac{c_1}{2}, \text{ and } \vec{r} = \frac{c_1}{2} + \begin{bmatrix} 1/3 \\ -2/3 \end{bmatrix}
\]

At \((4,5,7)\) when \( t = 2 \),

\[
\begin{bmatrix} 4 \\ 5 \\ 7 \end{bmatrix} = \frac{1}{2} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} (2)^2 + \begin{bmatrix} 1 \\ 2/3 \end{bmatrix} \Rightarrow \begin{cases} c_1 = 3/2 \\ c_2 = 3/2 \end{cases} \text{ and } \vec{a} = \begin{bmatrix} 3/2 \\ 3/2 \end{bmatrix}\]
Velocity and Position

r(t) is the position of a moving particle.

a) Describe, in words, what r' is parallel to.

b) Show that ||r(t)|| is constant iff r \perp r'.

\[ r' \text{ is parallel to the direction of motion, it points in the } \]

\[ \text{direction of motion.} \]

\[ \text{If } ||r'|| = c, \quad c = \text{constant}. \]

\[ \text{Then } ||r'||^2 = c^2 \]

\[ \Rightarrow r \cdot r' = c^2 \]

\[ \Rightarrow \frac{d}{dt} (r \cdot r') = 0 \]

\[ \Rightarrow r' \cdot r + r \cdot r' = 0 \]

\[ \Rightarrow r' \cdot r = 0, \text{ so } r \perp r'. \text{ AWESOME.} \]
The Hanging Cable

The hanging cable, also referred to as a catenary, has the shape:

\[ y = k(\cosh\left(\frac{x}{k}\right) - 1), \quad k = \text{constant related to stiffness of cable.} \]

As \( k \) increases, cable becomes more "stiff."

Photo by Flickr user Robert Valencia
A cable is suspended between two poles that are 10 m apart. Find the length of the cable, if the cable's shape is \( y(x) = k \left[ \cosh \left( \frac{x}{k} \right) - 1 \right] \). \textbf{Do not integrate.}

\[ L = \int \sqrt{1 + (y')^2} \, dx \]

\[ L = \int \sqrt{1 + \left( k \left( e^{t/k} - e^{-t/k} \right) \right)^2} \, dt \]

\[ L = \int |v| \, dt \]

\textbf{Let's try approach 2:}

Let \( x(t) = t \), \( y(t) = k \left( e^{t/k} + e^{-t/k} \right) \).

Then \( \dot{x} = \dot{y} = \frac{dt}{dt} = \frac{dt}{k \cosh(t/k) - k} = \left[ k \left( \frac{1}{k} (e^{t/k} - e^{-t/k}) - 0 \right) \right] \)

\[ L = \int |v| \, dt = \int \sqrt{1 + \left( e^{t/k} - e^{-t/k} \right)^2} \, dt \]

\[ = \int \sqrt{1 + e^{2t/k} + e^{-2t/k} - e^0 - e^0} \, dt \]

\[ = \int \sqrt{e^{2t/k} + e^{-2t/k} - 1} \, dt \]

\[ = \int \sqrt{e^{4t/k} + e^{-4t/k} - 4} \, dt \]

\[ = \int |v| \, dt \]

\[ = \int \sqrt{1 + \left( k \left( e^{t/k} - e^{-t/k} \right) \right)^2} \, dt \]

\[ = k \left( \frac{e^{t/k} - e^{-t/k}}{k} \right) \]

\[ = 2k \left( e^{5t/k} - e^{-5t/k} \right) \]

\textbf{Interpret result!}

\[ \text{Horizontal asymptote at } L = 10, \text{ as one would expect} \]
Recitation 05

Today's Topics
• Projectile Motion (13.2)
• Path Length and Tangential Vector (13.3)
• Curvature & Normal Vectors (13.4)

Today's Learning Objectives
• Apply vector function integration to determine path of projectiles
• Characterize motion of an object, in parametric form, in terms of its arc length and its tangential, normal and binormal vectors
**Announcements**

**Survey Results:** students want to collaborate, have trouble with technical issues and not knowing how to solve problems in group work. So let's use Adobe Connect, keep group size to 4 to 6, use group work on stuff covered from last assignments.

**Thursday Recitation:** 13.4, 13.5, Adobe Connect

**Graded Recitation Activity:** Next week during Tuesday recitation, question coming soon

**HW Due Tomorrow:** 13.4, 13.5

**Quiz 1:** Thur Jan 29

**Office Hours:** 7:30 pm – 8:30 pm, Wed Jan 21, Wed Jan 28

[https://georgiatech.adobeconnect.com/distancecalculusofficehours](https://georgiatech.adobeconnect.com/distancecalculusofficehours)

**Send Your TA an Email**

Explain, in an email, using your own words, what the following quantities represent:

- the unit tangent vector, $T(t)$
- the curvature, $\kappa$

Try to send this email by the end of the day today. If you send your TA an email with a description of what these quantities represent, you will get a reply.
Helpful Formulas

Ideal Projectile Motion: $\vec{r}(t) = (v_0 \cos \alpha) \hat{i} + \left( (v_0 \sin \alpha) t - \frac{gt^2}{2} \right) \hat{j}$

$v_0$ is the **initial velocity**, and $\alpha$ is the _angle from ground_.

max range: $R = \frac{v_0^2 \sin 2\alpha}{g}$

max height: $\frac{v_0^2 \sin^2 \alpha}{2g}$

Unit tangent vector $T = \frac{\vec{v}}{||\vec{v}||}$

Principle unit normal vector $N = \frac{\vec{T}'}{||\vec{T}'||}$

Binormal vector $B = \vec{T} \times \vec{N}$
1) Ball Rolling off of a Table (Projectile Motion, 13.2)
A ball rolls off a table 1 meter high with a speed of 0.5 m/s.
a) At what speed does the ball strike the floor?
b) Where does the ball strike the floor?

2) Golf Ball (Projectile Motion, 13.2)
A golfer can send a golf ball 300m across a level ground. From the tee in the figure, can the golfer clear the water?

3) Arc Length, Normal and Binormal Vectors (13.3, 13.4)
Consider the surfaces $x^2 + y^2 + z^2 = 4$, and $z^2 = x^2 + y^2$ for $z \geq 0$.
a) Find a parameterization for the intersection curve, $r(t)$, of the two surfaces.
b) Sketch the two surfaces and their intersection.
c) Calculate the length of $r(t)$.
d) Find the unit tangent, normal, and binormal vectors for $r(t)$ at the point $(\sqrt{2}, 0, \sqrt{2})$.
e) Add the three vectors to your sketch.
1) Ball Rolling off of a Table (Projectile Motion, 13.2)

A ball rolls off a table 1 meter high with a speed of 0.5 m/s.

a) What speed does the ball strike the floor?

b) Where does the ball strike the floor?

\[ \mathbf{a}(t) = \begin{bmatrix} 0 \\ -g \end{bmatrix}, \text{ so } \mathbf{v}(t) = \begin{bmatrix} c_1 \\ -gt + c_2 \end{bmatrix}. \text{ But } \mathbf{v}(0) = \begin{bmatrix} 0.5 \\ 0 \end{bmatrix}, \]

so \( c_1 = \frac{1}{2}, c_2 = 0 \). Thus, \( \mathbf{v}(t) = \begin{bmatrix} \frac{1}{2}t \\ -gt \end{bmatrix} \). Position \( \mathbf{r}(t) = \begin{bmatrix} \frac{1}{2}t + d_1 \\ -gt^2/2 + d_2 \end{bmatrix} \).

But \( \mathbf{r}(0) = \begin{bmatrix} 0 \\ 1 \end{bmatrix} \), so \( d_1 = 0, d_2 = 1 \).

Ball hits floor when \( 0 = -gt^2/2 + 1 \), or \( t = \sqrt{\frac{2}{g}} \)

\[ \Rightarrow |\mathbf{r}(\sqrt{\frac{2}{g}})| = \sqrt{\left(\frac{1}{2}\right)^2 + (g(\sqrt{\frac{2}{g}}))^2} \approx 4.455 \ldots \]

b) \( \mathbf{r}(\sqrt{\frac{2}{g}}) = \begin{bmatrix} \frac{1}{2}\sqrt{\frac{2}{g}} \\ -g(\sqrt{\frac{2}{g}})^2/2 + 1 \end{bmatrix} \approx \begin{bmatrix} 0.22576 \ldots \\ 0 \end{bmatrix} \)

\( \Rightarrow \) at point \((0.2, 0)\)
2) Golf Ball (Projectile Motion, 13.2)
A golfer can send a golf ball 300m across a level ground. From the tee in the figure, can the golfer clear the water?

\[ \vec{a} = \begin{bmatrix} 0 \\ -g \end{bmatrix} \]

\[ \vec{v}(t) = \begin{bmatrix} v_0 \cos \alpha \\ -gt + v_0 \sin \alpha \end{bmatrix} \]

Use range formula to get \( v_0 \). On level ground, range \( R \) is:

\[ R = 300 = \frac{v_0^2 \sin 2\alpha}{g} \]

Range \( R \) maximized when \( \alpha = \frac{\pi}{4} \), solving for \( v_0 \) yields \( v_0 = \sqrt{\frac{300g}{2}} \approx 84.25 \).

Velocity becomes:

\[ \vec{v}(t) = \begin{bmatrix} \sqrt{\frac{300g}{2}} \sin \left( \frac{\pi}{4} \right) \\ -gt + \sqrt{\frac{300g}{2}} \cos \left( \frac{\pi}{4} \right) \end{bmatrix} \]

Position \( \vec{r}(t) = \begin{bmatrix} v_0 \cos \alpha t + d_1 \\ -g \frac{t^2}{2} + v_0 \sin \alpha t + d_2 \end{bmatrix} \), but we'll use \( d_1 = d_2 = 0 \).

\( x \)-component is 310 when:

\[ 310 = v_0 \cos \alpha t \]

solving for \( t \) yields \( t \approx 8.08 \).

We need \( y \)-component to be \( > -20 \) when \( t = 8 \):

\[ -9 \left( \frac{8}{2} \right)^2 + \sqrt{\frac{300g \sin \frac{\pi}{4}}{2}} \]

\( \approx -11 \)

\( \Rightarrow \) YAY! Golfer can clear water.
3) Arc Length, Normal and Binormal Vectors (13.3, 13.4)

Consider the surfaces \( x^2 + y^2 + z^2 = 4 \), and \( z^2 = x^2 + y^2 \) for \( z \geq 0 \).

a) Find a parameterization for the intersection curve, \( r(t) \), of the two surfaces.

b) Sketch the two surfaces and their intersection.

c) Calculate the length of \( r(t) \).

d) Find the unit tangent, normal, and binormal vectors for \( r(t) \) at the point \((\sqrt{2}, 0, \sqrt{2})\).

e) Add the three vectors to your sketch.

\[
\begin{align*}
a) \quad & r(t) = \sqrt{2} \cos t, \quad r(t) = \sqrt{2} \sin t, \quad z = \sqrt{2} \\
\quad & x = \frac{x(t) = \sqrt{2} \cos t, \quad y(t) = \sqrt{2} \sin t,} \\
\quad & \frac{dt}{\sqrt{2}} = \sqrt{2} \end{align*}
\]

b) Cone

C) \( L = \int_0^{2\pi} \sqrt{(x')^2 + (y')^2 + (z')^2} \, dt = \sqrt{2} \int_0^{2\pi} dt \)

(Circumference of a circle is \( 2\pi r \), and radius = \( \sqrt{2} \))

d) \( \frac{\vec{T}}{1} = \frac{\vec{\dot{x}}}{\sqrt{\vec{\dot{x}} \cdot \vec{\dot{x}}}} = \frac{1}{\sqrt{2}} \begin{bmatrix} -\sqrt{2} \\ 0 \\ 0 \end{bmatrix}, \quad \vec{T}(0) = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \)

\( \frac{\vec{N}}{1} = \frac{\vec{\dot{y}}}{\sqrt{\vec{\dot{y}} \cdot \vec{\dot{y}}}} = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ -\sqrt{2} \\ 0 \end{bmatrix}, \quad \vec{N}(0) = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \)

\( \frac{\vec{B}}{1} = \frac{\vec{\dot{z}}}{\vec{\dot{z}} \cdot \vec{\dot{z}}} = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ 0 \\ -\sqrt{2} \end{bmatrix} \)
Recitation 06

Today's Topics:
- Curvature & Normal Vectors (13.4)
- Tangential and Normal Components of Acceleration (13.5)
- Velocity and Acceleration in Polar Coordinates (13.6)

Today's Learning Objectives
1. Given a motion of an object, in either parametric form or as a function of a single variable, calculate the
   - curvature
   - tangent, normal, and binormal vectors
   - acceleration (tangential and normal components)
   - torsion
2. Calculate the osculating, normal, and rectifying planes for a given curve \( \mathbf{r}(t) \) at a given value of \( t \)
Helpful Formulas

principle normal vector: \( \vec{N} = \frac{\vec{T}'(t)}{|\vec{T}'(t)|} \)

curvature: \( \kappa = \frac{1}{|\vec{v}|} |\vec{T}'(t)| \)

curvature: \( \kappa = \frac{|f''(x)|}{\left[1 + (f'(x))^2\right]^{3/2}} \)

acceleration: \( \vec{a} = a_T \vec{T} + a_N \vec{N} \)

\( a_T = \frac{d}{dt} |\vec{v}| \)

\( a_N = \sqrt{|\vec{a}|^2 - |a_T|^2} = \sqrt{|\vec{a}|^2 - (a_T)^2} \)

torsion: \( \tau = \frac{\begin{vmatrix} x' & y' & z' \\ x'' & y'' & z'' \\ x''' & y''' & z''' \end{vmatrix}}{|\vec{v} \times \vec{a}|^2} \)

Notes:
- One of the above equations has an error, where is it?
- There are alternate expressions for these formulas. Above are the formulas that the textbook uses.
Normal, Rectifying, and Osculating Planes

The geometry of the three planes determined by vectors $\mathbf{T}$, $\mathbf{N}$, and $\mathbf{B}$, for curve $\mathbf{r}(t)$, at $\mathbf{r}(t_0)$.

If a motion, $\mathbf{r}(t)$, lies completely in a plane, then the binormal vector is **CONSTANT**.

Graded Recitation Activity: Next week during Tuesday recitation, question sent
HW Due Tomorrow: 13.6
Quiz 1: Thur Jan 29
Office Hours: 7:30 pm – 8:30 pm, Wed Jan 28
https://georgiatech.adobeconnect.com/distancecalculusofficehours

Send Your TA an Email

Using your own words, describe

- the relationship between the curvature and the normal plane
- the relationship between the torsion and the osculating plane

Try to send an email with your answers by the end of the day today. If you send your TA an email with an answer to these questions you will get a response. *Hint: these relationships are described in the textbook.*
Group Work Activity: Part (a)

There are three parts to the following question. Solve them in groups of 3 to 5 students.

Consider \( \mathbf{r}(t) = \sin(t) \mathbf{i} + \cos(t) \mathbf{j} + \mathbf{k}, \ t = -\pi/2 \).

a) Find \( \mathbf{T}, \mathbf{N}, \) and \( \mathbf{B} \) at the given value of \( t \).

\[
\mathbf{T} = \frac{\mathbf{r}'}{\|\mathbf{r}'\|} = \frac{\begin{bmatrix} \cos(t) \\ -\sin(t) \end{bmatrix}}{1} = \begin{bmatrix} \cos(t) \\ -\sin(t) \end{bmatrix}, \quad \mathbf{N} = \frac{\mathbf{T} \times \mathbf{T}'}{\|\mathbf{T} \times \mathbf{T}'\|} = \begin{bmatrix} 0 \\ 1 \end{bmatrix}
\]

\[
\mathbf{T}(-\pi/2) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}
\]

\[
\mathbf{N} = \frac{\mathbf{T} \times \mathbf{T}'}{\|\mathbf{T} \times \mathbf{T}'\|} = \begin{bmatrix} 0 \\ 1 \end{bmatrix}
\]

\[
\mathbf{B} = \mathbf{T} \times \mathbf{N} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos(t) & -\sin(t) & 0 \\ 0 & 0 & -\cos(t) \end{vmatrix} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}
\]

\[
\Rightarrow \mathbf{N}(-\pi/2) = \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \quad \mathbf{B}(-\pi/2) = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}
\]

(Note that \( \mathbf{B} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \) at \( t = -\pi/2 \).)
Group Work Activity: Parts (b) and (c)

Consider \( \mathbf{r}(t) = \sin(t)\mathbf{i} + \cos(t)\mathbf{j} + \mathbf{k}, \ t = -\pi/2 \).

b) Sketch \( \mathbf{r} \) for \([0, 2\pi]\) and indicate the direction of motion.

c) Sketch \( \mathbf{T}, \mathbf{N}, \) and \( \mathbf{B} \) at the given value of \( t \).

\[ \begin{aligned}
\mathbf{r}(0) &= \begin{bmatrix} \sin(0) \\ \cos(0) \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}, \\
\mathbf{r}(\pi/2) &= \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \\
\end{aligned} \]

\[ \begin{aligned}
\mathbf{T}(\pi/2) &= \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}, \\
\mathbf{N}(\pi/2) &= \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \\
\mathbf{B}(\pi/2) &= \begin{bmatrix} 0 \\ 0 \end{bmatrix} \\
\end{aligned} \]

(Note that \( \mathbf{B} \) is a constant vector. Why is \( \mathbf{B} \) constant?)
Group Work Activity: Part (d)

Consider \( \mathbf{r}(t) = \sin(t)\mathbf{i} + \cos(t)\mathbf{j} + \mathbf{k}, \; t = -\pi/2 \).

d) Find the equation of the normal plane at \( t = -\pi/2 \).

\[ \mathbf{T} \text{ is perpendicular to normal plane.} \]

\[ \Rightarrow \text{NORMAL PLANE IS:} \]

\[ \mathbf{T} \cdot (\mathbf{r} - \mathbf{r}_0) = 0, \quad \mathbf{r}_0 = \text{any point in plane}. \]

\[
\begin{bmatrix}
0 \\
1 \\
0
\end{bmatrix} \cdot
\begin{bmatrix}
x \\
y \\
z
\end{bmatrix} = 0, \quad \text{or} \quad y = 0.
\]

\( x \text{ and } z \text{ are "free variables"} \)

\[ \text{NORMAL PLAN} \]

\[ \Rightarrow \text{T} \]
True or False

a) Curvature is a scalar and can be any real number.

This statement is ________ because: \( k > 0 \) so \( k \) can't be any real number.

b) Torsion is a scalar and can be any real number.

This statement is ________ because: torsion is any real number.

c) If \( r(t) = x(t)i + y(t)j \), then the normal vector, \( N \), is given by \( N = n/|n| \), where \( n = -x'(t)i + y'(t)j \).

This statement is ________ because:

\[ \frac{n'}{n} = \begin{bmatrix} -y' \\ x' \end{bmatrix} \]. This is an alternate formula from one of the homework exercises.
Recitation 07

Today’s Topics: Quiz 1 Review, Graded Recitation Activity 1

Quiz 1 Topics
12.6 Quadratic Surfaces
13.1 Vector Parametric Representations of Curves
13.2 Quadratic Surfaces
13.2 Projectile Motion
13.2 Path Length
13.3 Curvature & Normal Vectors
13.5 Tangential & Normal Components of Acceleration
Quiz 1 Learning Objectives

You should be able to do the following for Quiz 1.

- Identify and sketch quadratic surfaces given their algebraic equations
- Develop parameteric representations of curves
- Integrate vector functions to determine projectile motion
- Characterize a motion, given in either parametric form \( r(t) \), or as a continuous function \( f(x) \), using:
  - vectors: velocity, acceleration, tangent, binormal
  - scalars: curvature, torsion, tanential & normal components of accel, arc length
  - planes: tangential, rectifying, **Osculating**

![Diagram of a curve with tangent, normal, and osculating planes]
Helpful Formulas

Ideal Projectile Motion: \( \vec{r}(t) = (v_0 \cos \alpha) \hat{t} + \left( (v_0 \sin \alpha) t - \frac{gt^2}{2} \right) \hat{j} \)

max range: \( R = \frac{v_0^2 \sin 2\alpha}{g} \)  
max height: \( \frac{v_0^2 \sin^2 \alpha}{2g} \)

principle normal vector: \( \vec{N} = \vec{T}'(t) / |\vec{T}'(t)| \)
acceleration: \( \vec{a} = a_T \vec{T} + a_N \vec{N} \)

binormal vector: \( \vec{B} = \vec{N}'(t) / |\vec{N}'(t)| \)

curvature: \( \kappa = |\vec{T}'(t)| / |\vec{v}| \)

curvature: \( \kappa = |f''(x)| \left[ 1 + (f'(x))^2 \right]^{3/2} \)

\[
\tau = \frac{\begin{vmatrix} x' & y' & z' \\ x'' & y'' & z'' \\ x''' & y''' & z''' \end{vmatrix}}{|\vec{v} \times \vec{a}|^2}
\]
Graded Group Work Activity

Instructions
- Every student in your group needs to write their name or initials on the board.
- You have 20 minutes to answer the questions below.
- For full marks, show at least three intermediate steps for each question.
- Answer each question on a different slide.
- All students in the same group receive the same grade.
- Please do not share computers: every student should log in on their own computer.

1) Tangential & Normal Components of Acceleration (4 points)
   Let \( r(t) = 2ti + tj + 2t^2k \) be a motion. Compute the tangential and normal components of the acceleration.

2) Arc Length (3 points)
   Find the arc length, from 0 to \( t \), of the curve \( r(t) = e^t \cos(t)i + e^t \sin(t)j + 5e^t k \).
1) Tangential & Normal Components of Acceleration (4 points)

Let \( r(t) = 2t\mathbf{i} + tj + 2t^2\mathbf{k} \) be a motion. Compute the tangential and normal components of the acceleration.

\[
\mathbf{v} = \begin{bmatrix} 2 \\ 1 \\ 4t \end{bmatrix}, \quad \mathbf{a} = \begin{bmatrix} 0 \\ 0 \\ 4 \end{bmatrix}, \quad |\mathbf{v}| = \sqrt{2^2 + 1^2 + 4t^2}
\]

\[
\mathbf{T} = \frac{d}{dt}\left(\frac{\mathbf{v}}{|\mathbf{v}|}\right) = \frac{1}{|\mathbf{v}|} \frac{d}{dt}\mathbf{v} = \frac{1}{\sqrt{2^2 + 1^2 + 4t^2}} \begin{bmatrix} 2 \\ 1 \\ 4t \end{bmatrix} = \frac{1}{\sqrt{5 + 16t^2}} \begin{bmatrix} 2 \\ 1 \\ 4t \end{bmatrix}
\]

**TANGENTIAL**

\[
\mathbf{a}_T = \frac{d}{dt}\left(\frac{\mathbf{v}}{|\mathbf{v}|}\right) = \frac{1}{\sqrt{5 + 16t^2}} \begin{bmatrix} 2 \\ 1 \\ 4t \end{bmatrix}
\]

**NORMAL**

\[
|\mathbf{v} \times \mathbf{a}_{\perp}| = \frac{|\mathbf{v} \times \mathbf{a}|}{|\mathbf{v}|}
\]

1) \( \mathbf{a}_N = \sqrt{(0 + 0 + 4^2) - \frac{(16t)^2}{5 + 16t^2}} = \sqrt{16 - \frac{16^2t^2}{5 + 16t^2}} \)

2) \( \mathbf{a}_N = \frac{|\mathbf{v} \times \mathbf{a}_{\perp}|}{|\mathbf{v}|} = \frac{|\frac{1}{2} \begin{bmatrix} 2 & 1 & 4t \\ 0 & 0 & 0 \\ 0 & 0 & 4 \end{bmatrix}|}{\sqrt{2^2 + 1^2 + (4t)^2}} = \frac{\sqrt{16 + 64}}{\sqrt{5 + 16t^2}} \)
2) Arc Length (5 points)

Find the arc length, from 0 to $t$, of the curve $\mathbf{r}(t) = e^t \cos(t) \mathbf{i} + e^t \sin(t) \mathbf{j} + 5e^t \mathbf{k}$.

\[ \mathbf{v}(t) = \mathbf{r}'(t) = \begin{bmatrix} e^t \cos(t) - e^t \sin(t) \\ e^t \sin(t) + e^t \cos(t) \\ 5e^t \end{bmatrix}, \quad \cos t = c, \sin t = s \]

\[ L = \int_0^t |\mathbf{v}| \, dt = \int_0^t \left( 2e^t \cos^2 t + 2e^t \sin^2 t + 25e^{2t} \right)^{\frac{1}{2}} \, dt \]

\[ = \int_0^t \sqrt{27e^{2t}} \, dt \]

\[ = \sqrt{27} (e^t - 1) = 3\sqrt{3} (e^t - 1) \]

Message your TA when you've finished both questions, then move on to the remaining questions.
Curvature and Torsion

This question has 4 parts. Consider the surfaces $z = x^2 + y^2$ and $y = 2$, for $z \geq 0$.

A) Find a parametric vector representation for the intersection of the surfaces.

B) Sketch the intersection and the 2 surfaces.

A) Let $x = t$, $y$ has to be 2, so $z = t^2 + 4$.

\[ \mathbf{r}(t) = \begin{bmatrix} t \\ 2 \\ t^2 + 4 \end{bmatrix} \]

We can use other parameterizations, but this "works" because it satisfies the given equations.

B) Maximum Curvature $(0, 2, 4)$
Curvature and Torsion

This question has 4 parts. Consider the surfaces $z = x^2 + y^2$ and $y = 2$, for $z \geq 0$.

C) Calculate the curvature and identify on your sketch where the curvature is maximized.

C) $k = \frac{|f''|}{[1+(f')^2]^{3/2}}$, where $f = z(x) = x^2 + 4$

\[ k = \frac{2}{[1+(2x)^2]^{3/2}} \]

\[ k = \frac{2}{(1+4x)^{3/2}} \]

Alternately: $k = \frac{|\frac{d}{dx}(f')|}{|f'|}$ (more work)
Curvature and Torsion

This question has 4 parts. Consider the surfaces $z = x^2 + y^2$ and $y = 2$, for $z \geq 0$.

D) Calculate the torsion of the intersecting curve and explain your answer.

\[ \tau = \frac{0}{| \mathbf{\tau} |} = 0 \]

\[ \tau \text{ is } 0 \text{ because motion is planar.} \]
Recitation 09

R09 Topics
14.1 Functions of Several Variables
14.2 Limits and Continuity

R09 Learning Objectives
By the end of today’s session you should be able to

- Identify and sketch the domain of a function of several variables.
- Determine whether or not limits of functions of several variables exist.

While We’re Waiting to Start
Consider the function

\[ g(x, y) = \frac{\sqrt{y + 1}}{x^2 y + xy^2}. \]

For \( g(x, y) \) to be defined and a real-valued function, what values of \( x \) and \( y \) can we allow?
Domain of a Function of Two Variables

Identify and sketch the domain of

\[ g(x, y) = \frac{\sqrt{y + 1}}{x^2y + xy^2}. \]

Solution

For \( g(x, y) \) to be defined, its denominator cannot be zero. This implies that \( 0 \neq x^2y + xy^2 = xy(x + y) \). Thus, \( x \neq 0 \), \( y \neq 0 \), and \( y \neq -x \). The numerator of \( g(x, y) \) also cannot be complex, which implies that \( y + 1 \geq 0 \), or that \( y \geq -1 \). The domain is the set

\[ D = \{(x, y) | y \geq -1, x \neq 0, y \neq 0, y \neq -x\}. \]
Limits of a Function of Two Variables

Consider the function of two variables

\[ f(x, y) = \frac{x(x - 1)^3 + y^2}{4(x - 1)^2 + 9y^3}. \]

We want to evaluate

\[ \lim_{(x, y) \to (1, 0)} f(x, y) \]

What strategies might we try to evaluate the desired limit?

Solution
When we evaluate \( f(x, y) \) at the limit point, we find \( f(1, 0) \) is an indeterminant form of type 0/0. It may be that \( f \) is not continuous at the point \((1, 0)\). In one dimension, we would use l'Hopital's rule, or algebraic manipulation, to evaluate such a limit. But l'Hospital's rule only works for functions of one variable. So for this limit, we will try approaching the limit point along curves that pass through the limit point. In this case, we can try evaluating the limit along \( y = m(x - 1) \).
Limits of a Function of Two Variables, Example 1

Evaluate

\[
\lim_{(x,y) \to (1,0)} \frac{x(x - 1)^3 + y^2}{4(x - 1)^2 + 9y^3}
\]

**Solution**

Choose a function, \( y(x) \), that passes through the given limit point \((1, 0)\). We can try \( y = m(x - 1) \), which passes through \((1, 0)\), and see what happens.

\[
\lim_{(x,y) \to (1,0)} \frac{x(x - 1)^3 + y^2}{4(x - 1)^2 + 9y^3} = \lim_{(x,y) \to (1,0)} \frac{x(x - 1)^3 + m^2(x - 1)^2}{4(x - 1)^2 + 9m^3(x - 1)^3}
\]

\[
= \lim_{(x,y) \to (1,0)} \frac{x(x - 1) + m^2}{4 + 9m^3(x - 1)}
\]

\[
= \frac{m^2}{4}
\]

Because the value of the limit depends on the path of approach, the limit does not exist.
Limits of a Function of Two Variables, Example 2

In groups of 3 to 5 students, evaluate the limit

\[
\lim_{(x,y) \to (0,0)} \frac{xy^2}{x^2 + y^4}.
\]

**Solution**

Along the path \( y = mx \), we obtain

\[
\lim_{(x,y) \to (0,0)} \frac{xy^2}{x^2 + y^4} = \lim_{(x,y) \to (0,0)} \frac{xm^2 x^2}{x^2 + m^4 x^4} = \lim_{(x,y) \to (0,0)} \frac{m^2 x}{1 + m^4 x^2} = 0.
\]

We might be tempted to believe that this limit exists. But along the path \( x = my^2 \), we find

\[
\lim_{(x,y) \to (0,0)} \frac{xy^2}{x^2 + y^4} = \lim_{(x,y) \to (0,0)} \frac{my^4}{m^2 y^4 + y^4} = \frac{m}{m^2 + 1}
\]

Because the value of the limit depends on the path of approach, the limit does not exist.
Definition of Limit

Evaluating limits along paths will not show that a given limit exists. To show that a limit exists, we can use the definition of limit.

The limit of $f(x, y)$ as $(x, y)$ approach $(a, b)$ is $L$ if for every number $\epsilon > 0$, there is a corresponding $\delta > 0$ such that

$$|f(x, y) - L| < \epsilon \quad \text{when} \quad 0 < \sqrt{(x - a)^2 + (y - b)^2} < \delta$$

In other words, the distance between $f$ and $L$ can be made \textit{arbitrarily} small by making the distance from $(x, y)$ to $(a, b)$ \textit{sufficiently} small.
An Epsilon Delta Example

Evaluate, or show that the following limit does not exist.

\[
\lim_{{(x,y) \to (0,0)}} \frac{3x^2 y}{x^2 + y^2}.
\]

Solution
Along the path \( y = mx \), we obtain

\[
\lim_{{(x,y) \to (0,0)}} \frac{3x^2 y}{x^2 + y^2} = \lim_{{(x,y) \to (0,0)}} \frac{3m^2 x^3}{x^2 (1 + m^2)} = 0
\]

Along the path \( y = mx \), the limit is zero. We can also show that along the path \( y = mx^2 \), that the limit is also zero. So we are starting to suspect that this limit exists and that \( L = 0 \). Let \( \epsilon > 0 \). We want to find a \( \delta > 0 \) such that

\[
|f(x, y) - L| < \epsilon \quad \text{when} \quad 0 < \sqrt{(x - a)^2 + (y - b)^2} < \delta
\]

We will do this on the next few slides.
An Epsilon Delta Example

We want to find a $\delta > 0$ such that

$$|f(x, y) - L| < \epsilon \quad \text{when} \quad 0 < \sqrt{(x - a)^2 + (y - b)^2} < \delta$$

The limit point is $(0, 0)$, so $a = b = 0$. And we think the limit might equal zero, so we can try $L = 0$ and see what happens.

$$\left| \frac{3x^2 y}{x^2 + y^2} - 0 \right| < \epsilon \quad \text{when} \quad 0 < \sqrt{x^2 + y^2} < \delta$$

However,

$$\left| \frac{3x^2 y}{x^2 + y^2} - 0 \right| = \frac{3x^2 |y|}{x^2 + y^2} \leq \frac{3(x^2 + y^2)|y|}{x^2 + y^2} = 3|y| = 3\sqrt{y^2} \leq 3\sqrt{x^2 + y^2}$$

This result will suggest that we choose $\delta = \epsilon/3$. We see why on the next slide.
An Epsilon Delta Example

We have found that

\[ |f(x, y) - L| = \left| \frac{3x^2 y}{x^2 + y^2} - 0 \right| \leq 3 \sqrt{x^2 + y^2} \]

Choosing \( \delta = \epsilon / 3 \), and letting \( 0 < \sqrt{x^2 + y^2} < \delta \), we obtain

\[ |f(x, y) - L| \leq 3 \delta = 3(\epsilon / 3) = \epsilon \]

Thus, given any \( \epsilon \), choosing \( \delta = \epsilon / 3 \), and \( 0 < \sqrt{x^2 + y^2} < \delta = \epsilon / 3 \), we can guarantee that \( |f(x, y) - L| < \epsilon \).

Therefore, the limit exists and is equal to 0.
Conclusions: Evaluating Limits of Multivariable Functions

Suppose we need to evaluate a limit of a function of two variables

$$\lim_{(x,y) \to (a,b)} f(x, y).$$

If we know that $f(x, y)$ is continuous at $(a, b)$, we can evaluate the limit with direct substitution. If we don’t know that $f(x, y)$ is continuous at $(a, b)$, we can either

- evaluate the limit along curves ($y = mx$, for example) to see if the limit does not exist, or
- we can use the definition of limit to prove that the limit does exist and determine what the limit is equal to.

Notes:

- evaluating a limit along curves cannot tell us that a given limit exists, it can only tell us whether it doesn’t exist
- I’m assuming you’re familiar with continuity for a function of several variables, but if you aren’t it’s on the next homework and isn’t a difficult concept.
R10 Topics
14.2 Limits and Continuity
14.3 Partial Derivatives
14.4 The Chain Rule

R10 Learning Objectives
By the end of today’s session you should be able to

▸ Determine whether or not limits of functions of several variables exist by evaluating the limit along paths or by using the formal definition of limit.

▸ Compute partial derivatives of multivariable functions using the chain rule.

While We’re Waiting to Start
Calculate $f_y(1, -2, -1)$ for $f(x, y, z) = x^2 ye^{y/z}$.
A Partial Derivative

Calculate \( f_y(1, -2, -1) \) for \( f(x, y, z) = x^2 ye^{y/z} \).

Solution

\[
\begin{align*}
  f_y &= \frac{\partial f}{\partial y} \left( x^2 ye^{y/z} \right) \\
  &= x^2 e^{y/z} + x^2 ye^{y/z} \left( \frac{\partial}{\partial y} \frac{y}{z} \right) \\
  &= x^2 e^{y/z} + \frac{x^2 ye^{y/z}}{z} \\
\end{align*}
\]

Thus, \( f_y(1, -2, -1) = (1)^2 e^2 + \frac{(1)^2(-2)e^2}{-1} = 3e^2 \).
A Conceptual Question

Select all options that are correct.

Given a function $f(x, y)$, to evaluate $\frac{\partial f}{\partial x}$ at the point (1,3), we can:

1. Differentiate $f$ with respect to $x$ and then set $x = 1, y = 3$.
2. Set $x = 1, y = 3$ and then differentiate $f$ with respect to $x$.
3. Set $x = 1$ and then differentiate $f$ with respect to $x$.
4. Set $y = 3$ and then differentiate $f$ with respect to $x$.

Solution

The first option is acceptable and is the usual approach.

The second and third options would result in an answer of zero: we should differentiate with respect to the prescribed variable, $x$, and then set the variable equal to its value.

The fourth option is acceptable, because variables other than the one that we are differentiating are treated as constants.
Recall: Definition of Limit

Evaluating limits along paths will not show that a given limit exists. To show that a limit exists, we can use its formal definition.

The limit of \( f(x, y) \) as \((x, y)\) approach \((a, b)\) is \( L \) if for every number \( \epsilon > 0 \), there is a corresponding \( \delta > 0 \) such that

\[
|f(x, y) - L| < \epsilon \quad \text{when} \quad 0 < \sqrt{(x - a)^2 + (y - b)^2} < \delta
\]

In other words, the distance between \( f \) and \( L \) can be made \textit{arbitrarily} small by making the distance from \((x, y)\) to \((a, b)\) \textit{sufficiently} small.
Epsilon Delta Definition of Limit

Use the definition of limit to show that the following exists and is equal to 0.

\[
\lim_{(x,y) \to (0,0)} f(x, y) = \lim_{(x,y) \to (0,0)} \frac{x + y}{x^2 + 1}
\]

Solution

To apply the definition of limit, we start with \( |f(x, y) - L| \), and work towards an expression that involves \( \sqrt{(x - a)^2 + (y - b)^2} \). We know are given that the limit is equal to zero, so we can use \( L = 0 \). We also know that the limit point is \((0, 0)\), so we can also use \( a = b = 0 \).

\[
|f(x, y) - L| = \left| \frac{x + y}{x^2 + 1} - 0 \right|
\]

\[
= \frac{|x + y|}{|x^2 + 1|}
\]

\[
\leq \frac{|x + y|}{1} \quad \text{because } x^2 + 1 \geq 1
\]

\[
= |x + y|
\]

\[
\leq |x| + |y| \quad \text{by the triangle inequality}
\]
Epsilon Delta Definition of Limit

\[ |f(x, y) - L| \leq |x| + |y| \]

\[
= \sqrt{x^2} + \sqrt{y^2} \\
\leq \sqrt{x^2 + y^2} + \sqrt{x^2 + y^2} \\
= 2\sqrt{x^2 + y^2}
\]

This result suggests that we choose \( \delta = \epsilon/2 \). By choosing \( \delta = \epsilon/2 \), and letting \( 0 < \sqrt{x^2 + y^2} < \delta \), we obtain

\[ |f(x, y) - L| \leq 2\sqrt{x^2 + y^2} < 2\delta = 2(\epsilon/2) = \epsilon \]

Thus, given any \( \epsilon \), choosing \( \delta = \epsilon/2 \), and \( 0 < \sqrt{x^2 + y^2} < \delta = \epsilon/2 \), we can guarantee that \( |f(x, y) - L| < \epsilon \).

Therefore, the limit exists and is equal to 0.
Group Work Activities

Solve the following in groups of 3 to 5 students.

1. Evaluate the following limit, or show that it does not exist.

\[
\lim_{(x,y,z) \to (0,0,0)} \frac{x^2 - y^2 - z^2}{x^2 + y^2 + z^2}.
\]

2. Evaluate the following limit, or show that it does not exist.

\[
\lim_{(x,y) \to (0,0)} \frac{xy}{x^2 + y^2}.
\]

3. Calculate \(du/dt\) given that \(u = x^2 - y^2\), \(x = t^2 - 1\), and \(y = 3 \sin(\pi t)\). Simplification is not necessary.

4. The radius of a cylinder is decreasing at a rate of 2 cm/s while its height is increasing at a rate of 3 cm/s. At what rate is the volume changing when the radius is 10 cm and the height is 100 cm?

5. Create a function, \(f(x, y)\), that satisfies the following

\[
\frac{\partial f(x, y)}{\partial x} = x^2 + y, \quad \text{and} \quad \frac{\partial f(x, y)}{\partial y} = y^3 + x.
\]
Question 1: Limits

Evaluate, or show that the following limit does not exist.

\[
\lim_{(x,y,z) \to (0,0,0)} \frac{x^2 - y^2 - z^2}{x^2 + y^2 + z^2}.
\]

Solution

Along the \(x\)-axis, \(y = z = 0\), and the limit becomes

\[
\lim_{(x,y,z) \to (0,0,0)} \frac{x^2 - 0 - 0}{x^2 + 0 + 0} = 1.
\]

Along the \(y\)-axis, \(x = z = 0\), and the limit becomes

\[
\lim_{(x,y,z) \to (0,0,0)} \frac{0 - y^2 - 0}{0 + y^2 + 0} = -1.
\]

Depending on which path we approach the limit point, we arrive at different values. Therefore the limit does not exist (DNE).
Question 2: Limits

Evaluate, or show that the following limit does not exist.

\[ \lim_{(x,y) \to (0,0)} \frac{xy}{x^2 + y^2}. \]

Solution
Along the line \( y = mx \), the limit becomes

\[ \lim_{(x,y) \to (0,0)} \frac{mx^2}{x^2 + m^2 x^2} = \lim_{(x,y) \to (0,0)} \frac{mx^2}{x^2(1 + m^2)} = \frac{m}{1 + m^2}. \]

Depending on which path we approach the limit point, we arrive at different values. Therefore the limit does not exist (DNE).
Question 3: The Chain Rule

Calculate \( du/dt \) given that \( u = x^2 - y^2 \), \( x = t^2 - 1 \), and \( y = 3 \sin(\pi t) \). Simplification is not necessary.

Solution

We can approach this in two different ways. We can use the chain rule, as follows.

\[
\frac{\partial u}{\partial t} = \frac{\partial u}{\partial x} \frac{dx}{dt} + \frac{\partial u}{\partial y} \frac{dy}{dt}
\]

\[
= 2x \cdot 2t + (-2y)(3\pi \cos(\pi t))
\]

\[
= 4t(t^2 - 1) - 6 \sin(\pi t) \cdot 3\pi \cos(\pi t)
\]

An also substitute our known values for \( x \) and \( y \) first, and then differentiate.

\[
\frac{\partial u}{\partial t} = \frac{\partial}{\partial t}(x^2 - y^2) = \frac{\partial}{\partial t} \left((t^2 - 1)^2 - (3 \sin(\pi t))^2\right)
\]

\[
= 2(t^2 - 1)(2t) - 6\pi \sin(\pi t) \cdot 3 \cos(\pi t)
\]
Question 4: The Chain Rule

The radius of a cylinder is decreasing at a rate of 2 cm/s while its height is increasing at a rate of 3 cm/s. At what rate is the volume changing when the radius is 10 cm and the height is 100 cm?

Solution

\[ V = \pi R^2 H \]

\[ \frac{\partial V}{\partial t} = \frac{\partial V}{\partial R} \frac{dR}{dt} + \frac{\partial V}{\partial H} \frac{dH}{dt} \]

\[ = \frac{\partial (\pi R^2 H)}{\partial R} (-2) + \frac{\partial (\pi R^2 H)}{\partial H} (3) \]

\[ = 2\pi RH(-2) + (\pi R^2)(3) \]

\[ = -4\pi RH + 3\pi R^2 \]

When \( R = 10 \) and \( H = 100 \), we have

\[ \frac{\partial V}{\partial t} = -4\pi \cdot 10 \cdot 100 + 3\pi(10)^2 = -4000\pi + 300\pi = -3700\pi. \]
Question 5: Partial Derivatives

Create a function, \( f(x, y) \), that satisfies the following

\[
\frac{\partial f(x, y)}{\partial x} = x^2 + y, \quad \text{and} \quad \frac{\partial f(x, y)}{\partial y} = y^3 + x
\]

Solution
A function whose derivative with respect to \( x \) is \( x^2 + y \) is

\[ f = \frac{x^3}{3} + xy + C(y), \] where \( C \) is some function of \( y \). Differentiating with respect to \( y \) gives us \( f_y = 0 + x + C'(y) \). Thus, by comparison, \( C'' = y^3 \), and \( C = \frac{y^4}{4} \). Thus

\[ f(x, y) = \frac{x^3}{3} + xy + C(y) = \frac{x^3}{3} + xy + \frac{y^4}{4}. \]
Recitation 11

R11 Topics
14.5 The Gradient

R11 Learning Objectives
By the end of today’s session you should be able to do the following.

▶ Compute gradients and directional derivatives.
▶ Provide geometric interpretations of gradients and directional derivatives.
▶ Describe the relationship between gradients and level curves.

While We’re Waiting to Start
Consider \( f(x, y) = y^2 e^{2x} \).

1. Find the direction of steepest ascent at \( P(0, 1) \) and at \( Q(0, -1) \).
2. Sketch the level curves of \( f \), and the gradient vectors at \( P \) and \( Q \).
3. Find the rate at which \( f \) is increasing in the direction \( \vec{u} = \hat{i} - \hat{j} \) at \( P \).
The Gradient and Directional Derivative

Consider \( f(x, y) = y^2 e^{2x} \).

1. Find the direction of steepest ascent at \( P(0, 1) \) and at \( Q(0, -1) \).
2. Sketch the level curves of \( f \), and the gradient vectors at \( P \) and \( Q \).
3. Find the rate at which \( f \) is increasing in the direction \( \mathbf{u} = \mathbf{i} - \mathbf{j} \) at \( P \).

Solution
The direction of steepest ascent at any point is given by the gradient.

\[
\nabla f = \begin{bmatrix} \frac{\partial}{\partial x} f \\ \frac{\partial}{\partial y} f \end{bmatrix} = \begin{bmatrix} 2y^2 e^{2x} \\ 2ye^{2x} \end{bmatrix}
\]

The direction of steepest ascent at \( P \) and \( Q \) are:

\[
\nabla f(0, 1) = \begin{bmatrix} 2 \\ 2 \end{bmatrix}, \quad \nabla f(0, -1) = \begin{bmatrix} 2 \\ -2 \end{bmatrix}
\]

The level curves are obtained by setting \( f(x, y) = C \), where \( C \) is a value in the range of \( f \). \( C = y^2 e^{-2x} \) implies \( y = \pm \sqrt{Ce^{-x}} \). We will plot the curves on the next slide.
The Gradient and Directional Derivative

The gradient vectors at points $P(0, 1)$ and $Q(0, -1)$ should be perpendicular to the level curves (apologies for the rough drawing).

The rate at which $f(x, y)$ is increasing at $P$ in the direction $\mathbf{u} = \hat{i} - \hat{j}$ is given by the dot product:

$$\nabla f(0, 1) \cdot \begin{bmatrix} 1 \\ -1 \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \end{bmatrix} \cdot \begin{bmatrix} 1 \\ -1 \end{bmatrix} = 2 - 2 = 0$$

Thus, the rate of change of $f$ in the direction of $\mathbf{u}$ is zero. Vector $\mathbf{u}$ points in the direction of a level curve of $f(x, y)$. 

Recitation 11, Slide 3
Wolfram Alpha’s Plots of $f(x, y)$

In case it helps see what is going on, to the left are plots of our function, $y^2 e^{2x}$, that WolframAlpha produces.

Notice that the contour plot gives a set of level curves.
Level Curves

If $C$ is in the ________________ of $f(x, y)$, then the curve $C = f(x, y)$ is a level curve of $f(x, y)$. For functions of two variables, we can think of level curves as curves of constant height (analogous to topographic maps, that have curves of constant elevation).

In other words, a level curve is an intersection between $f(x, y)$ and the plane $z = C$. Level curves are a useful view of the overall behavior of a function.
Level Curves and the Gradient

*This following helps explain why the gradient is $\perp$ to level curves.*

Let $C = g(x, y)$ be a level curve of $g(x, y)$. Show that $\nabla g$ is always perpendicular to the level curve.

**Solution**

Let $\vec{r}(t)$ be a parameterization of the curve $g(x, y) = C$. A vector that is parallel to the curve at any $t$ is $\vec{v}(t) = \vec{r}'(t)$. We will show that the gradient is perpendicular to $\vec{v}(t)$ for all $t$.

Because of our parameterization, $C = g(x, y) = g(x(t), y(t))$, and by the chain rule,

$$\frac{dg}{dt} = 0 = \frac{\partial g}{\partial x} \frac{dx}{dt} + \frac{\partial g}{\partial y} \frac{dy}{dt} = \begin{bmatrix} g_x \\ g_y \end{bmatrix} \cdot \begin{bmatrix} \frac{dx}{dt} \\ \frac{dy}{dt} \end{bmatrix} = \nabla g \cdot \vec{v}$$

Thus, the gradient is always perpendicular to the level curve $C = g(x, y)$. 

Recitation 11, Slide 6
A Conceptual Question: The Gradient

At which point does the gradient vector have the largest magnitude? Draw the gradient at this point.

1. (0,0)
2. (8,-8)
3. (6,-2)
4. (-4,-4)

Solution
The magnitude of the gradient is $|\nabla f| = \sqrt{f_x^2 + f_y^2}$. At (6, -2), the contour lines are most closely packed: $f$ is changing most rapidly at that point. The gradient points in the direction of steepest ascent and is perpendicular to the level curve at (6, -2), so $\nabla f$ points to the right.
Group Work Activities

Solve the following in groups of 3 to 5 students.

1. Find the directional derivative of \( f = z \ln(x/y) \) at \((1, 1, 2)\) towards the point \((2, 2, 1)\) and provide a geometric interpretation of your answer.

2. For \( z = 3xy - x^3 - y^3 \), find the points where the gradient vector, \( \nabla z(x, y) \), is the zero vector. Provide a geometric interpretation of your answer.

3. Suppose \( \vec{F} = \nabla f(x, y) = (2x + \sin y)\hat{i} + (x \cos(y) - 2y)\hat{j} \). Find \( f(x, y) \).
**Question 1: A Directional Derivative**

Find the directional derivative of \( f = z \ln(x/y) \) at \((1, 1, 2)\) towards the point \((2, 2, 1)\). Provide a geometric interpretation of your answer.

**Solution**

For clarity, I’m writing out more steps than are needed. We’re using the Chain Rule a few times in this problem.

\[
\nabla f = \frac{\partial}{\partial x} \left( z \ln(x/y) \right) \hat{i} + \frac{\partial}{\partial y} \left( z \ln(x/y) \right) \hat{j} + \frac{\partial}{\partial z} \left( z \ln(x/y) \right) \hat{k}
\]

\[
= z \frac{\partial}{\partial x} \ln(x/y) \hat{i} + z \frac{\partial}{\partial y} \ln(x/y) \hat{j} + \ln(x/y) \frac{\partial}{\partial z} (z) \hat{k}
\]

\[
= z \frac{1}{x/y} \frac{\partial}{\partial x} (x/y) \hat{i} + z \frac{1}{x/y} \frac{\partial}{\partial y} (x/y) \hat{j} + \ln(x/y) \hat{k}
\]

\[
= \frac{z}{x} \hat{i} - \frac{z}{y} \hat{j} + \ln(x/y) \hat{k}
\]

\[
\nabla f (1, 1, 2) = 2\hat{i} - 2\hat{j} + 0\hat{k}
\]

On the next slide we will find the directional derivative and provide a geometric interpretation.
Question 1: A Directional Derivative (Continued)

Let the vector pointing from \((1, 1, 2)\) to \((2, 2, 1)\) be \(\vec{u}\). The desired directional derivative is the dot product \(\nabla f \cdot \vec{u}\).

\[
\nabla f(1, 1, 2) \cdot \vec{u} = \begin{bmatrix} 2 \\ -2 \\ 0 \end{bmatrix} \cdot \begin{bmatrix} 2 - 1 \\ 2 - 1 \\ 1 - 2 \end{bmatrix} = \begin{bmatrix} 2 \\ -2 \\ 0 \end{bmatrix} \cdot \begin{bmatrix} 1 \\ 1 \\ -1 \end{bmatrix} = 0
\]

Therefore, the directional derivative, at the point \((1, 1, 2)\), in the direction pointing towards \((2, 2, 1)\), is zero. Geometrically, this means that the value of the function \(f\) is not changing in the specified direction.
Question 2: Zero Gradient

For $z = 3xy - x^3 - y^3$, find the points where the gradient vector, $\nabla z(x, y)$, is the zero vector. Provide a geometric interpretation of your answer.

Solution

$$\nabla z = \begin{bmatrix} \frac{\partial}{\partial x} z \\ \frac{\partial}{\partial y} z \end{bmatrix} = \begin{bmatrix} 3y - 3x^2 \\ 3x - 3y^2 \end{bmatrix}$$

The gradient vector has zero magnitude when

$$0 = 3y - 3x^2$$
$$0 = 3x - 3y^2$$

Rearranging these equations yields the two curves $y = x^2$ and $x = y^2$. These curves intersect at two points, $(0, 0)$, and $(1, 1)$. Geometrically, these points correspond to points where the function $z(x, y)$ is flat. In other words, where its tangent plane is horizontal. These points could also indicate local minima/maxima.
Question 3: Constructing a Function From its Gradient

Suppose $\vec{F} = \nabla f(x, y) = (2x + \sin y)i + (x \cos(y) - 2y)j$. Find $f(x, y)$.

Solution

A function whose derivative with respect to $x$ is $2x + \sin y$ is

$$f = x^2 + x \sin y + C(y),$$

where $C$ is some function of $y$. Differentiating with respect to $y$ gives us $f_y = 0 + x \cos y + C'(y)$. Thus, by comparison, $C' = -2y$, and $C = -y^2$. Thus

$$f(x, y) = x^2 + x \sin y + C(y) = x^2 + x \sin y - y^2.$$
Recitation 12

R12 Topics
14.6 Tangent Planes and Differentials
14.7 Absolute Min/Max

R12 Learning Objectives
By the end of today’s session you should be able to do the following.

▶ Find equations of tangent planes and normal lines of surfaces.
▶ Apply tangent planes and differentials to make approximations.
▶ Locate and classify critical points of surfaces.

Example 1
Consider the surface $x^2 + 4y^2 = z^2$.

1. Find the equation of the tangent plane at $P(3, 2, 5)$.
2. Find the equation of the normal line at $P$, and identify where the normal line intersects the xy-plane.
3. Sketch the surface and the normal line.
Example 1: Part 1

Consider the surface \( x^2 + 4y^2 = z^2 \). Find the equation of the tangent plane at \( P(3, 2, 5) \).

**Solution**

The surface may be represented by the function \( f(x, y, z) = x^2 + y^2 - z^2 \). A normal vector at any point on the surface is given by the gradient \( \nabla f(x, y, z) \).

\[
\nabla f(x, y, z) = \begin{bmatrix}
\frac{\partial}{\partial x} f \\
\frac{\partial}{\partial y} f \\
\frac{\partial}{\partial z} f
\end{bmatrix} = \begin{bmatrix}
2x \\
8y \\
-2z
\end{bmatrix} \quad \Rightarrow \quad \nabla f(3, 2, 5) = \begin{bmatrix}
6 \\
16 \\
-10
\end{bmatrix}
\]

The equation for the tangent plane is the dot product between a normal vector and a vector in the tangent plane.

\[
0 = \nabla f(3, 2, 5) \cdot \begin{bmatrix}
x - 3 \\
y - 2 \\
z - 5
\end{bmatrix} = 6(x - 3) + 16(y - 2) - 10(z - 5)
\]

This simplifies to \( 3x + 8y - 5z = 0 \).
Example 1: Part 2

Consider the surface $x^2 + 4y^2 = z^2$. Find the equation of the normal line at $P(3, 2, 5)$, and identify where the normal line intersects the xy-plane.

Solution

Recall that the scalar parametric equations for a line are given by $\vec{r}(t) = \vec{r}_0 + \vec{d}t$, where $\vec{r}_0$ is a point on the line, $\vec{d}$ is a direction vector. But $\nabla f$ is parallel to the normal line. So the normal line is given by

$$\vec{r} = \vec{r}_0 + \nabla ft = \begin{bmatrix} 3 \\ 2 \\ 5 \end{bmatrix} + \begin{bmatrix} 3t \\ 8t \\ -5t \end{bmatrix}$$

If you prefer, we could also write the normal line as:

$$x = 3 + 3t, \quad y = 2 + 8t, \quad z = 5 - 5t.$$

The line intersects the xy-plane when $z = 0$, or when $t = 1$. Substituting $t = 1$ into the above equations yields the point $(6, 10, 0)$. 
Example 1: Part 3

Consider the surface $x^2 + 4y^2 = z^2$. Sketch the surface and the normal line.

Solution
Tangent Planes and Differentials (14.6)

For a function of one variable, \( y(x) \), we define the differential \( dy \) as

\[
dy = \frac{dy}{dx} dx,
\]

where \( dy \) is the change in height of the tangent line.

For a function of two variables, \( z(x, y) \), we define the differential \( dz \) as

\[
dz = \text{__________},
\]

where \( dz \) is the change in height of the ____________.

The equation of the tangent plane to \( z = z(x, y) \) at the point \( \vec{r}_0 \) is

\[
z = z_0 + \nabla z \cdot (\vec{r} - \vec{r}_0)
\]

The vector \( \vec{r} - \vec{r}_0 \) is a vector in the tangent plane.
A Quick Calculation: Tangent Plane Approximation

Suppose $z_x(3, 4) = 5$, $z_y(3, 4) = -2$, and $z(3, 4) = 6$. Assuming the function $z$ is differentiable, what is the best estimate for $z(3.1, 3.9)$ using this information?

1. 6.3
2. 9
3. 6
4. 6.7

Solution

The correct answer is 6.7.

Since we are moving .1 units in the $x$ direction, the function increases from 6 to approximately $6 + .1 \times 5 = 6.5$. By similar reasoning, when we move in the $y$ direction, the height is approximately $6.5 + (-.1)(-2) = 6.7$. 

Estimating Change in Volume

Estimate, using the tangent plane approximation, the change in volume of a cylinder if its height is changed from 12.0 to 12.2 cm and the radius is changed from 8.0 to 7.7 cm. How much does the volume actually change?

Solution
Using \( V = \pi R^2 H \), \( R = 8 \), \( H = 12 \), \( dR = -0.3 \), \( dH = 0.2 \), we obtain

\[
\begin{align*}
    dV &= \frac{\partial V}{\partial R} dR + \frac{\partial V}{\partial H} dH \\
    &= (2\pi RH) dR + (\pi R^2) dH \\
    &= 2\pi (8)(12)(-0.3) + \pi (8)^2 (0.2) \\
    &= -44.8\pi \\
    &\approx -140.74
\end{align*}
\]

The estimate gives us a decrease in volume of about 140.74 cm\(^3\). The actual change in volume is \( V(12.2, 7.7) - V(12, 8) \) which, plugging everything into a calculator, is roughly 140.31 cm\(^3\).
Second Derivative Test (14.7)

Suppose $f$ has continuous $2^{nd}$ order partial derivatives around some point $P(x_0, y_0)$, and that $\nabla f(x_0, y_0) = 0$. Let

$$D = \frac{\partial^2 f}{\partial x^2} \frac{\partial^2 f}{\partial y^2} - \left( \frac{\partial^2 f}{\partial x \partial y} \right)^2$$

If $D = 0$, then ____________.
If $D < 0$, then $P$ is a saddle point.
If $D > 0$, then $P$ is a maximum if $f_{xx} < 0$ and a minimum if $f_{xx} > 0$. 

Recitation 12, Slide 8
Find the critical points of \( f(x, y) = y + x \sin(y) \) and determine whether they correspond to local or absolute minimums or maximums of \( f(x, y) \).

**Solution**

The critical points are points where \( \nabla f = \vec{0} \).

\[
\vec{0} = \nabla f(x, y) = \sin y \hat{i} + (1 + x \cos y) \hat{j}
\]

But \( \sin y = 0 \) implies that \( y = N\pi \), where \( N \) is any integer. But \( \cos(N\pi) = (-1)^N \), so \( x = \pm 1 \). The stationary points are located at the points \((-1, 2\pi N)\) and at \((1, 2\pi(N + 1))\).

To determine whether these points correspond to local min/max, we use the second derivatives test.

\[
D = f_{xx} f_{yy} - f_{xy}^2 = 0 - (\cos(N\pi))^2 = -1 < 0
\]

All of the critical points correspond to saddle points. A plot of the surface, shown on the next slide, helps us see that this is the case.
**Solution**

Notice how there are no local min/max at the points $(-1, 2\pi N)$, $(1, 2\pi (N + 1))$.

In fact, the function has no local min/max values at all.
Group Work Activities

Solve the following in groups of 3 to 5 students.

1. Consider the function \( f(x, y) = 3xy - x^3 - y^3 \).
   1.1 Find the points where the gradient vector, \( \nabla f(x, y) \), is the zero vector.
   1.2 Find the points where the tangent plane is horizontal.
   1.3 Find the critical points of \( f(x, y) \). Classify these points as min, max, or saddle points.

2. Find an equation of the tangent plane and normal line to \( z = (x^2 + y^2)^2 \) at \( P(1, 1, 4) \).
Question 1.1: Zero Gradient

For \( f = 3xy - x^3 - y^3 \), find the points where the gradient vector, \( \nabla f(x, y) \), is the zero vector.

Solution

Note: this question was explored in the previous recitation.

\[
\nabla f = \begin{bmatrix} 3y - 3x^2 \\ 3x - 3y^2 \end{bmatrix}
\]

The gradient vector has zero magnitude when

\[
0 = 3y - 3x^2 \\
0 = 3x - 3y^2
\]

Rearranging these equations yields the two curves \( y = x^2 \) and \( x = y^2 \). These curves intersect at two points, \((0, 0)\), and \((1, 1)\). These are the only two points where the gradient is zero.
Consider the function \( f(x, y) = 3xy - x^3 - y^3 \). Find the points where the tangent plane is horizontal. Find the critical points of \( f(x, y) \). Classify these points as min, max, or saddle points.

**Solution**

The tangent plane is horizontal at points where \( \nabla z(x, y) \) is the zero vector. We found these points to be \((0, 0)\), and \((1, 1)\).

These two points \((0, 0)\), and \((1, 1)\) could also indicate local minima/maxima. We use the second derivative test to tell us if they are.

\[
D = f_{xx}f_{yy} - f_{xy}^2 = (9x)(9y) - (3)(3) = 81xy - 9
\]

At \((0, 0)\), \(D\) is negative, so we have a saddle at \((0, 0)\).
At \((1, 1)\), \(D\) is positive, so we have a local maximum at \((1, 1)\) because \(f_{xx}\) is also positive.
Question 2

Find an equation of the tangent plane and normal line to \( z = (x^2 + y^2)^2 \) at \( P(1, 1, 4) \).

Solution

Set \( f(x, y, z) = (x^2 + y^2)^2 - z \).

\[
\nabla f(x, y, z) = \begin{bmatrix}
\frac{\partial}{\partial x} f \\
\frac{\partial}{\partial y} f \\
\frac{\partial}{\partial z} f
\end{bmatrix} = \begin{bmatrix}
4x(x^2 + y^2) \\
4y(x^2 + y^2) \\
-1
\end{bmatrix} \quad \rightarrow \nabla f(1, 1, 4) = \begin{bmatrix}
8 \\
8 \\
-1
\end{bmatrix}
\]

Thus, the tangent plane is given by \( 8(x - 1) + 8(y - 1) - (z - 4) = 0 \), which simplifies to \( 8x + 8y - z = 12 \). The normal line is given by the parametric equations

\[
x = 1 + 8t, \quad y = 1 + 8t, \quad z = 4 - t.
\]

Office Hours
I’ll hold the usual additional office hours and drop-in session (same times and URLs as last quiz).

While We’re Waiting to Start
Find the dimensions of a rectangular box of maximum volume such that the sum of its 12 lengths is a constant $L$. 
Dimensions of a Rectangular Box

Find the dimensions of a rectangular box of maximum volume such that the sum of its 12 lengths is a constant $L$.

**Solution**

Letting the dimensions be $a$, $b$, and $c$, then $V = abc$. To incorporate the length constraint, we will eliminate $c$ by using $4a + 4b + 4c = L$, or $c = L/4 - a - b$. The volume is

\[
V = abc = ab(L/4 - a - b) = abL/4 - a^2b - ab^2
\]

\[
V_a = bL/4 - 2ab - b^2 = 0 \Rightarrow 2a + b = L/4
\]

\[
V_b = aL/4 - a^2 - 2ab = 0 \Rightarrow 2b + a = L/4
\]

Solving these two questions yields $a = b = L/12$. Not surprisingly, $c = L/12$. From the geometrical nature of this problem, this critical point corresponds to a maximum.

Thus, the rectangular box is a cube with sides of length $L/12$.

Note that another approach to this problem would be to use Lagrange Multipliers, but we haven’t explored that method yet in our course.
Quiz 2

Quiz 2 Learning Objectives
For Quiz 2, you should be able to do the following.

▶ Determine whether or not limits of functions of several variables exist by evaluating the limit along paths or by using the formal definition of limit.
▶ Compute partial derivatives of multi-variable functions using the chain rule.
▶ Compute gradients and directional derivatives.
▶ Provide geometric interpretations of gradients and directional derivatives.
▶ Describe the relationship between gradients and level curves and surfaces.
▶ Apply the gradient to find equations of tangent planes, normal lines and tangent lines of surfaces.
▶ Apply tangent planes and differentials to make approximations.
▶ Locate and classify critical points of surfaces.
Graded Recitation Activity 2

Instructions

▶ Every student in your group needs to write their name or initials on the board.
▶ You have 20 minutes to answer the questions below.
▶ For full marks, show at least two intermediate steps for each question.
▶ Answer each question on a different slide.
▶ All students in the same group receive the same grade.
▶ Please do not share computers: every student should log in on their own computer.
▶ You do not need to simplify your answers.

**Question 1** (3 points)
Consider the surface \( x^2yz + xy - y^2z^2 = -27 \).

1. Find an equation of the tangent plane to the surface at the point \((1, 3, 2)\).
2. Find a parameterization of the normal line at the point \((1, 3, 2)\).

**Question 2** (2 points)
Consider the surface \( z = x^3y - x^2y^2 \). Find a normal vector to \( z \) at \((2, 1, 4)\).
Consider the surface \( x^2yz + xy - y^2z^2 = -27 \). Find an equation of the tangent plane to the surface at the point \((1, 3, 2)\).

**Solution**

Let \( F(x, y, z) = x^2yz + xy - y^2z^2 \). A vector that is perpendicular to this surface at any point is \( \nabla F \).

\[
\nabla F(x, y, z) = \begin{bmatrix}
\frac{\partial}{\partial x} F \\
\frac{\partial}{\partial y} F \\
\frac{\partial}{\partial z} F
\end{bmatrix} = \begin{bmatrix}
2xyz + y \\
x^2z + x - 2yz^2 \\
x^2y - 2y^2z
\end{bmatrix} \Rightarrow \nabla F(1, 3, 2) = \begin{bmatrix}
15 \\
-21 \\
-33
\end{bmatrix}
\]

We now have a vector that is normal to the surface at \((1, 3, 2)\). The dot product between this vector, and any vector in the plane, is going to be zero.

\[
0 = \nabla F(1, 3, 2) \cdot \begin{bmatrix}
x - 1 \\
y - 3 \\
z - 2
\end{bmatrix} = \begin{bmatrix}
15 \\
-21 \\
-33
\end{bmatrix} \cdot \begin{bmatrix}
x - 1 \\
y - 3 \\
z - 2
\end{bmatrix}
\]

Thus, the tangent plane is given by \( 15(x - 1) - 21(y - 3) - 33(z - 2) = 0 \), which simplifies to \( 15x - 21y - 33z = -114 \).
Consider the surface $x^2yz + xy - y^2z^2 = -27$. Find a parameterization of the normal line at the point $(1, 3, 2)$.

**Solution**
The normal line is given by the parametric equations

\[
x = 1 + 15t, \quad y = 3 - 21t, \quad z = 2 - 33t.
\]
Consider the surface $z = x^3y - x^2y^2$. Find a normal vector to $z$ at $(2, 1, 4)$.

**Solution**

Let $F(x, y, z) = x^3y - x^2y^2 - z$. Then the surface $z$ has a normal vector given by the gradient $\nabla F$.

\[
\nabla F(x, y, z) = \begin{bmatrix}
\frac{\partial}{\partial x}F \\
\frac{\partial}{\partial y}F \\
\frac{\partial}{\partial z}F
\end{bmatrix} = \begin{bmatrix}
3x^2y - 2xy^2 \\
x^3 - 2x^2y \\
-1
\end{bmatrix}
\]

\[
\nabla F(2, 1, 4) = \begin{bmatrix}
3(2)^2(1) - 2(2)(1)^2 \\
2^3 - 2(2)^2(1) \\
-1
\end{bmatrix} = \begin{bmatrix}
8 \\
0 \\
-1
\end{bmatrix}
\]

A vector that is normal to the surface is $[8, 0, -1]$. Another normal vector is $[-8, 0, 1]$. 
Tangent Line

Find an equation for the tangent line to the curve of intersection of the surfaces $z = x^2 + y^2$ and $4x^2 + y^2 + z^2 = 9$ at $(-1, 1, 2)$.

Solution

Let $f = z - x^2 - y^2$ and $g = 4x^2 + y^2 + z^2 - 9$. Then the tangent line is perpendicular to both $\nabla f$ and $\nabla g$. Vector $\vec{v} = \nabla f \times \nabla g$ is parallel to the desired tangent line (the textbook explains why in Section 14.6).

\[
\nabla f(x, y, z) = \begin{bmatrix} -2x \\ -2y \\ 1 \end{bmatrix}, \quad \nabla f(-1, 1, 2) = \begin{bmatrix} 2 \\ -2 \\ 1 \end{bmatrix}
\]

\[
\nabla g(x, y, z) = \begin{bmatrix} 8x \\ 2y \\ 2z \end{bmatrix}, \quad \nabla g(-1, 1, 2) = \begin{bmatrix} -8 \\ 2 \\ 4 \end{bmatrix}
\]

\[
\nabla f(-1, 1, 2) \times \nabla g(-1, 1, 2) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -2 & 1 \\ -8 & 2 & 4 \end{vmatrix} = \begin{bmatrix} -10 \\ 16 \\ -12 \end{bmatrix}
\]

Parametric vector equations for the tangent line at $(-1, 1, 2)$ are

\[
x = -1 - 10t, \quad y = 1 - 16t, \quad z = 2 - 12t.
\]
Absolute Max/Min

Find the absolute maximum and minimum of the function

\[ f(x, y) = 4xy^2 - x^2y^2 - xy^3 \]

in the closed triangle bounded by the lines \( x = 0 \), \( y = 0 \) and \( y = 6 - x \).

Solution

We will first consider the boundaries of the triangular region, and then investigate the interior.

The Boundaries of the Triangular Region

There are three boundaries we must consider.

- Everywhere along \( x = 0 \), \( f(0, y) = 0 \).
- Everywhere along \( y = 0 \), \( f(x, 0) = 0 \).
- Along \( y = 6 - x \), and \( f(x, 6 - x) = -2x(x - 6)^2 \). Taking the derivative and setting the result to zero gives us

\[
0 = f_x(x, 6 - x) = -6(x^2 - 8x + 12) = -6(x - 2)(x - 6).
\]

This suggests that \( x = 2 \) and \( x = 6 \) could be min/max, so we can evaluate \( f \) at these points \( f(2, 4) = -64 \), and \( f(6, 0) = 0 \).

On the next slide, we will look at the interior of the region.
Absolute Max/Min

The Interior of the Region

\[ f_x = 4y^2 - 2xy^2 - y^3 = 0 \] implies that either \( y = 0 \) or \( y = 4 - 2x \). But \( y = 0 \) is not in the interior (it is along the boundary, which we’ve already looked at).

\[ f_y = 8xy - 2x^2y - 3xy^2 = 0 \] implies that either \( y = 0 \) or \( 8x - 2x^2 - 3xy = 0 \). By substitution,

\[
0 = 8x - 2x^2 - 3xy = 8x - 2x^2 - 3x(4 - 2x) = 4x(x - 1)
\]

Thus, \( x = 0 \) or \( x = 1 \). Again, \( x = 0 \) is not in the interior of our region. When \( x = 1, y = 4 - 2(1) = 2 \). So for the interior, we need only consider the point \( (1, 2) \), and \( f(1, 2) = 4 \)

Putting everything together, we have:

\[
\begin{align*}
\quad f(0, y) &= 0 \\
\quad f(x, 0) &= 0 \\
\quad f(2, 4) &= -64 \\
\quad f(1, 2) &= 4
\end{align*}
\]

The absolute maximum is \( f(1, 2) = 4 \) and the absolute minimum is \( f(2, 4) = -64 \).
R15 Topics
14.8 Lagrange Multipliers (LM)

R15 Learning Objectives
- Solve constrained optimization problems using LM.
- Compare LM to other approaches that solve constrained optimization problems.

While We’re Waiting to Start
A wire in the shape of a circle of radius 1 has temperature $T(x, y) = xy$.

1. Sketch the level curves of $T$.
2. Based on your sketch, where are $\nabla T$, and the normal vector to the wire, parallel?
3. Find the hottest and coldest points on the wire using LM.
4. Describe another method of finding the hottest and coldest points, and why it may not work in more complex situations.
Constrained Temperature Optimization

A wire in the shape of a circle of radius 1 has a temperature of \( T(x, y) = xy \).

1. Sketch the level curves of \( T \).
2. Based on your sketch, where are \( \nabla T \), and the normal vector to the wire, parallel?

Solution

The level curves have the form \( C = xy \), or \( y = C/x \), for constant \( C \). The plot below shows the level curves for positive temperatures in red, negative in blue, and the wire in black. The four points where \( \nabla T \) looks parallel to \( \nabla g \) are also shown.

It would seem from our sketch that the hottest points occur at the points \((1/\sqrt{2}, 1/\sqrt{2})\) and \((-1/\sqrt{2}, -1/\sqrt{2})\), and the coldest points occur at \((-1/\sqrt{2}, 1/\sqrt{2})\) and \((1/\sqrt{2}, -1/\sqrt{2})\). It is at these points that \( \nabla T \) seems to be parallel to \( \nabla g \), where \( g(x, y) = x^2 + y^2 - 4 \).
Constrained Temperature Optimization

A wire in the shape of a circle of radius 1 has a temperature of $T(x, y) = xy$. Find the hottest and coldest points on the wire using LM.

Solution

Let the constraint be $g(x, y) = x^2 + y^2 - 1 = 0$. The coldest and warmest points correspond to where the two gradients are parallel: $\nabla T = \lambda \nabla g$. The constant $\lambda$ is an unknown parameter. Calculating the gradients gives us:

$$
\begin{bmatrix}
  y \\
  x
\end{bmatrix} = \begin{bmatrix}
  \lambda 2x \\
  \lambda 2y
\end{bmatrix}
$$

Substitution yields $y = 2\lambda (2\lambda y) = 4\lambda^2 y$, which has the solutions $y = 0$ or $\lambda = \pm 1/2$. If $y = 0$, then $x = 0$, which is not a point on the wire. Thus, $\lambda$ must be $\pm 1/2$, which means $y = \pm x$.

The constraint $x^2 + y^2 = 1$ implies we have four solutions, $(1/\sqrt{2}, 1/\sqrt{2})$, $(-1/\sqrt{2}, -1/\sqrt{2})$, $(1/\sqrt{2}, -1/\sqrt{2})$, and $(-1/\sqrt{2}, 1/\sqrt{2})$.

Since $T$ is positive in the first and third quadrants and negative in the other two, the first two points are the warmest points, and the other two are the coldest points on the wire.
Constrained Temperature Optimization

Describe another method of locating the hottest and coldest points, and why it may not work in more complex situations.

Parametric Representations
The constraint is specified by the unit circle, so we can identify a parametric representation of the constraint curve, with \( x(t) = \cos t, \ y(t) = \sin t \). Then \( g = 0 \) is satisfied, and \( T(x, y) = T(x(t), y(t)) \). We can find the warmest and coldest points by solving \( 0 = \frac{d}{dt} T = \frac{d}{dt} (\cos t \sin t) \). This approach works for the given problem. But for more complicated constraints, \( g(x, y) \), it may not be possible to find a parametric representation.

Cross Product of the Gradients
The cross product of two parallel vectors is the zero vector. Knowing that we need points where \( \nabla T \) and \( \nabla g \) are parallel, we can instead solve

\[
\vec{0} = \begin{vmatrix} i & j & k \\ T_x & T_y & 0 \\ g_x & g_y & 0 \end{vmatrix} = (T_x g_y - T_y g_x) \hat{k} = (y^2 - x^2) \hat{k}
\]

The rest of the solution is straightforward. This method is efficient because we have functions of two variables and did not need to introduce \( \lambda \). But if we had functions of 3 variables, the resulting algebra could be tedious.
A Definition of the Method of LM

If point \((x_0, y_0, z_0)\) is a function \(f(x, y, z)\), subject to \(g(x, y, z) = 0\), then \(\nabla f\) and \(\nabla g\) are parallel at \((x_0, y_0, z_0)\), and there exists a constant \(\lambda\), such that

\[
\nabla f(x_0, y_0, z_0) = \lambda \nabla g(x_0, y_0, z_0)
\]

The scalar \(\lambda\) is called a *Lagrange multiplier*.

Note also that the above definition applies to when there is only one constraint, \(g\). Your textbook also describes an approach for when there are two constraints: if we wish to minimize/maximize \(f\) subject to \(g\) and to \(h\), then we solve

\[
\nabla f = \lambda \nabla g + \mu \nabla h
\]

In this case, we have two Lagrange multipliers, \(\lambda\) and \(\mu\).

**Solution**

minimizes or maximizes
Test Your Understanding of LM

Where is the absolute maximum value of \( f(x, y) = x + y \), subject to \( xy = 9 \), located?

1. (3,3)
2. (3,3) and (-3,-3)
3. (3,3), (-3,3), (3,-3), and (-3,-3)
4. There is no absolute maximum value.

Solution

There is no absolute maximum value of \( f \) subject to the given constraint. If we were to use LM, we would solve \( \nabla f = \lambda \nabla g \), along with \( xy = 9 \). Calculating the gradients gives us

\[
\begin{bmatrix} 1 \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} y \\ x \end{bmatrix}.
\]

If \( 1 = \lambda y \), then \( \lambda \neq 0 \). And if \( \lambda x = \lambda y \), then we can divide by \( \lambda \) to obtain \( x = y \). Thus,

\[
xy = 9 \quad \Rightarrow \quad x^2 = 9 \quad \Rightarrow \quad x = \pm 3.
\]

Thus, we have two points where the gradients are parallel, (3, 3) and (-3, -3). But we need to find the absolute maximum value of \( f(x, y) \). This problem is continued on the next slide.
We have two points where the gradients are parallel, at $(3, 3)$ and $(-3, -3)$. But what do these points correspond to? Are they local minima? Local maxima?

Maximizing $f(x, y)$ along the curve $xy = 9$ implies that we are interested in values of $f$ along $y = 9/x$. Along this curve, our function becomes $f = x + 9/x$, shown to the right. This function has critical points at $x = 3$ and at $x = -3$. We can also see that $(-3, -3)$ corresponds to a local maximum, and $(3, 3)$ corresponds to a local minimum.

But there is no absolute maximum, because $f \to \infty$ as $x \to \infty$ along the curve $xy = 9$.

Conclusion: LM only gives us points where gradients are parallel. Extra work is needed to determine if these points are local/absolute min/max.
Group Work Activities

Solve the following in groups of 3 to 5 students.

1. Find the distance from the point \( P(0, 1) \) to the curve \( x^2 = 4y \).
2. The volume of a cylindrical tank with hemispherical ends must be 100 cubic meters. What dimensions of the tank minimizes its surface area?
Distance From a Point to a Curve

1) Find the minimum distance from the point \( P(0, 1) \) to the curve \( x^2 = 4y \).

Solution
We can minimize the square of the distance, \( d(x, y) = x^2 + (y - 1)^2 \), subject to the constraint curve \( g(x, y) = x^2 - 4y = 0 \).

\[
\nabla d(x, y) = \begin{bmatrix} 2x \\ 2(y - 1) \end{bmatrix}, \quad \nabla g = \begin{bmatrix} 2x \\ -4 \end{bmatrix}
\]

The minimum must occur where \( \nabla d \) is parallel to \( \nabla g \). We can proceed by either solving \( \nabla d = \lambda \nabla g \), or by using a cross product.

Solve Using \( \nabla d = \lambda \nabla g \)
We must solve the equations

\[
2x = 2x \lambda \\
2(y - 1) = -4 \lambda
\]

The first equation implies that either \( x = 0 \) or \( \lambda = 1 \). If \( x = 0 \), then from our constraint curve, \( y = 0 \). If \( \lambda = 1 \), then \( y = -1 \) but \( y \) can’t be negative (because \( x^2 = 4y \)). We therefore have the point \( (0, 0) \). And \( d(0, 0) = 1 \).
**Distance From a Point to a Curve**

**Alternate Solution: Cross Product**
The cross product of parallel vectors is zero, and we are looking for points where two vectors are parallel. We can also use a cross product to solve this problem.

\[
\vec{0} = \begin{bmatrix} 2x \\ 2(y - 1) \\ 0 \end{bmatrix} \times \begin{bmatrix} 2x \\ -4 \\ 0 \end{bmatrix} = \left| \begin{array}{ccc}
  i & j & k \\
 2x & 2(y - 1) & 0 \\
 2x & -4 & 0 \\
\end{array} \right| = ( -8x - 4x(y - 1) ) \hat{k} = (-4x - 4xy) \hat{k}
\]

Thus, \(-4x - 4xy = 0\), or \(x(y + 1) = 0\). As before, \(y\) can’t be negative, so \(x = 0\). And since \(x^2 = 4y\), \(x = y = 0\). The distance is \(d(0, 0) = 1\).
Minimizing Surface Area of a Tank

2) The volume of a cylindrical tank with hemispherical ends must be 100 cubic meters. What dimensions of the tank minimizes its surface area?

Solution

We want to minimize $S = 4\pi R^2 + 2\pi RL$, subject to $V = \frac{4}{3}\pi R^3 + \pi R^2 L = 100$. We could substitute one expression into the other to obtain a function of one variable which we can minimize, or we can use LM. To use LM, we set $g = g(R, L) = \frac{4}{3}\pi R^3 + \pi R^2 L - 100$. Then $\nabla S = \lambda \nabla g$ yields

$$\nabla S = \lambda \nabla V$$

$$\begin{bmatrix} 8\pi R + 2\pi L \\ 2\pi R \end{bmatrix} = \lambda \begin{bmatrix} 4\pi R^2 + 2\pi RL \\ \pi R^2 \end{bmatrix}$$

Thus, $\lambda = 2/R$, and

$$8\pi R + 2\pi L = (2/R)(4\pi R^2 + 2\pi RL)$$

$$4R + L = 4R + 2L$$

Thus, $L = 0$, the volume constraint gives $R = (75/\pi)^{1/3}$, and $S = 4\pi (75/\pi)^{2/3}$. 

Recitation 15, Slide 11
Recitation 16

R16 Topics
14.8 Lagrange Multipliers
14.9 Taylor’s Formula for Two Variables
14.10 Partial Derivatives with Constrained Variables

R16 Learning Objectives
▶ Derive the least squares equations to fit the plane $Ax + By + C$ to a set of given points (14.8).
▶ Calculate a cubic approximation to a function of two variables at a specified point (14.9).
▶ Apply the chain rule to compute partial derivatives with intermediate variables (14.10).

While We’re Waiting to Start
Let $L = f(U, V, S)$, and $S = 3UV$. Calculate or derive expressions for the following derivatives.

A) $\left( \frac{\partial S}{\partial V} \right)_U$
B) $\frac{dS}{dV}$
C) $\left( \frac{\partial L}{\partial V} \right)_U$
D) $\left( \frac{\partial L}{\partial V} \right)_{S,U}$
The Chain Rule with Intermediate Variables, Parts A and B

Let \( L = f(U, V, S) \), and \( S = 3UV \). Calculate or derive expressions for the following derivatives.

A) \( \left( \frac{\partial S}{\partial V} \right)_U \)  

B) \( \frac{dS}{dV} \)

Solution
A) The notation \( \left( \frac{\partial S}{\partial V} \right)_U \) implies that \( V \) and \( U \) are independent variables, and that \( S \) is a dependent variable. Using \( S = 3UV \), we obtain

\[
\left( \frac{\partial S}{\partial V} \right)_U = \frac{\partial}{\partial V} (3UV) = 3U
\]

B) The derivative \( dS/dV \) implies that \( S \) is a dependent variable, and \( V \) is an independent variable. \( U \) is not identified as either an independent or as a dependent variable, and so we must assume that \( U \) is an intermediate variable (\( U \) could be a function of \( V \)). Using the equation \( S = 3UV \), we obtain

\[
\frac{dS}{dV} = \frac{d}{dV} (3UV) = 3V \frac{dU}{dV} + 3U = 3VU' + 3U
\]
The Chain Rule with Intermediate Variables, Parts C and D

Let $L = f(U, V, S)$, and $S = 3UV$. Calculate or derive expressions for the following derivatives.

C) \( \left( \frac{\partial L}{\partial V} \right)_U \)

D) \( \left( \frac{\partial L}{\partial V} \right)_{S,U} \)

Solution

C) $V$ and $U$ are identified as independent variables. $S$ is an intermediate variable and could be a function of $V$, so

\[
\left( \frac{\partial L}{\partial V} \right)_U = \frac{\partial f}{\partial V} + \frac{\partial f}{\partial S} \frac{\partial S}{\partial V} = \frac{\partial f}{\partial V} + \frac{\partial f}{\partial S} 3U
\]

D) $V$, $U$, and $S$ are independent variables, so

\[
\left( \frac{\partial L}{\partial V} \right)_{S,U} = \frac{\partial f}{\partial V}
\]

If you want to check your results for parts C and D, it may help to substitute a function for $f(U, V, S)$ and see what happens, such as $f = 4U^2VS$. It may also help to use more familiar variables, so that $S = 3xy$ and $L = f(x, y, z)$. 

Recitation 16, Slide 3
## Taylor Approximation (14.9)

Calculate the cubic approximation to \( f(x, y) = 4x \cos(y) \) near the origin. Complete this question in group work. \textit{Note: this was a pop quiz in 2014. Solution} (below is a screen capture of my notes from 2014)

\[
\begin{array}{|c|c|}
\hline
\text{DERIVATIVE} & \text{EVALUATE AT (0,0)} \\
\hline
f_x = 4c & 4 \\
f_y = -4x \cdot s & 0 \\
f_{xx} = 0 & 0 \\
f_{xy} = -4s & 0 \\
f_{yy} = -4x \cdot c & 0 \\
f_{xxy} = 0 & 0 \\
f_{xyy} = 0 & -4 \\
f_{yyyy} = 4xs & 0 \\
\hline
\end{array}
\]

\[
\Rightarrow f \approx 0 + \frac{1}{1!}(4x + 0y) + \frac{1}{2!}(0x^2 + 0xy + 0y^2) + \frac{1}{3!}(0x^3 + 30x^2y - 3 \cdot 4xy^2 + 0y^3) \\
= 4x - 2xy^2
\]
Use your results from the previous problem to find the quadratic approximation to \( f(x, y) = 4x \cos(y) \) near the origin. Then estimate the error in the approximation if \(|x| < 0.5\) and \(|y| < 0.1\).

**Solution**

Taylor's formula for a quadratic approximation is

\[
f(x, y) = f(0, 0) + (xf_x + yf_y) + \frac{1}{2}(x^2 f_{xx} + 2xy f_{xy} + y^2 f_{yy})
\]

Using our results from the previous problem, our quadratic approximation is \( f = 4x \). The maximum error of this approximation is given by the next term in the expansion, which is

\[
|E(x, y)| \leq \left| \frac{1}{3!} \left( x^3 f_{xxx} + 3x^2 y f_{xxy} + 3xy^2 f_{xyy} + y^3 f_{yyy} \right) \right|
\]

\[
= \frac{1}{3!} \left| (x^3 \cdot 0 + 3x^2 y \cdot 0 + 3xy^2 \cdot (-4) + y^3 \cdot 0) \right|
\]

\[
= \frac{1}{3!} \left| (-12xy^2) \right| = 2|x|y^2.
\]

Therefore, the desired error estimate is

\[
|E(0.5, 0.1)| \leq 2(0.5)(0.1)^2 = 0.01.
\]
Least Squares (14.8)

The plane \( z = Ax + By + C \) is to be fitted to a given set of points, \((x_n, y_n, z_n)\). Derive the linear system of equations that, when solved, minimizes

\[
E = \sum_{n=1}^{N} (Ax_n + By_n + C - z_n)^2.
\]

Solution

We must find an expression that, given a set of data points, returns the values of \( A, B, \) and \( C \) that minimizes \( E \). To minimize \( E \), we take the derivatives of \( E \) with respect to the independent variables \( A, B, \) and \( C \), and set these 3 equations to zero. In doing so, we can treat \( x_n, y_n, \) and \( z_n \) as constants.

\[
0 = \frac{\partial E}{\partial A} = \frac{\partial}{\partial A} \sum_{n=1}^{N} (Ax_n + By_n + C - z_n)^2
\]

\[
= \sum_{n=1}^{N} 2(Ax_n + By_n + C - z_n) \frac{\partial}{\partial A} (Ax_n + By_n + C - z_n)
\]

But \( \frac{\partial}{\partial A} (Ax_n + By_n + C - z_n) = x_n \), because \( \frac{\partial}{\partial A} (By_n + C - z_n) = 0 \).

Remember that we are treating \( x_n, y_n, \) and \( z_n \) as constants.
Least Squares (continued)

We will also divide both sides of the equation by 2 to obtain the following.

\[
0 = \frac{\partial E}{\partial A} = 2 \sum_{n=1}^{N} (Ax_n + By_n + C - z_n) \frac{\partial}{\partial A} (Ax_n + By_n + C - z_n)
\]

\[
= 2 \sum_{n=1}^{N} (Ax_n + By_n + C - z_n)x_n
\]

\[
= \sum_{n=1}^{N} Ax_n x_n + \sum_{n=1}^{N} By_n x_n + C \sum_{n=1}^{N} x_n - \sum_{n=1}^{N} z_n x_n
\]

\[
\sum_{n=1}^{N} z_n x_n = A \sum_{n=1}^{N} (x_n)^2 + B \sum_{n=1}^{N} y_n x_n + C \sum_{n=1}^{N} x_n
\]

\[
= \begin{bmatrix}
\sum_{n=1}^{N} (x_n)^2 & \sum_{n=1}^{N} x_n y_n & \sum_{n=1}^{N} x_n
\end{bmatrix}
\begin{bmatrix}
A \\
B \\
C
\end{bmatrix}
\]

In the last step above we expressed our sum as a vector product. A similar process for the derivatives $E_B$ and $E_C$ yields equations on the next slide.
Least Squares (continued)

Calculating the partial derivative $E_B$ and setting it equal to zero gives us

$$\sum_{n=1}^{N} z_n y_n = \begin{bmatrix} \sum_{n=1}^{N} x_n y_n & \sum_{n=1}^{N} (y_n)^2 & \sum_{n=1}^{N} y_n \end{bmatrix} \begin{bmatrix} A \\ B \\ C \end{bmatrix}$$

Likewise, $E_C = 0$ gives us the following.

$$\sum_{n=1}^{N} z_n = \begin{bmatrix} \sum_{n=1}^{N} x_n & \sum_{n=1}^{N} y_n & \sum_{n=1}^{N} 1 \end{bmatrix} \begin{bmatrix} A \\ B \\ C \end{bmatrix}$$

Note that $\sum_{n=1}^{N} 1 = N$. Putting our three vector product equations together gives us the linear system of equations that we were asked to find.

$$\begin{bmatrix} \sum z_n x_n \\ \sum z_n y_n \\ \sum z_n \end{bmatrix} = \begin{bmatrix} \sum (x_n)^2 & \sum x_n y_n & \sum x_n \\ \sum x_n y_n & \sum (y_n)^2 & \sum y_n \\ \sum x_n & \sum y_n & N \end{bmatrix} \begin{bmatrix} A \\ B \\ C \end{bmatrix}$$

15.2 Double Integrals over General Regions
15.3 Area by Double Integration

**R17 Learning Objectives**

- Construct a double integral that represents the area of a region bounded by a set of given curves in Cartesian coordinates.
- Change the order of integration of a double integral (Cartesian coordinates).

**Today’s Questions**
Sketch the region bounded by the given curves and construct a double integral that represents its area.

a) \( y = \sqrt{x}, \ y = x^3 \).

b) \( x = 5 - y, \ x = 2y - 1, \ y = 1 \).

c) \( y = x - 6, \ y^2 = x \).
GRA3, Next Tuesday (5 points)
Suppose we wanted to locate all the minimums and maximums of $x^2y^2$ subject to $(x^2 + y^2)^2 + xy^2 = 1$. Reduce this problem to the problem of solving three equations in three unknowns. Do not solve the equations you derive.

Quiz 3: One Week from Thursday
Quiz 3 may cover 14.8 to 14.10, and 15.1 to 15.4. We’ll see.

Wolfram Alpha Syntax for Double Integrals
You may want to use Wolfram Alpha to check your answers while completing your HW. Suppose that we want to determine the value of

$$\int_{-2}^{-1} \int_{0}^{x-1} (x^{2C} + y)dydx$$

The syntax we could use to compute this particular integral is the following.

\text{integrate x}^{2C} + y, \text{ x from -2 to -1 and y from 0 to (x-1)}
1a) Area of a Region

Sketch the region bounded by \( y = \sqrt{x}, y = x^3 \) and construct a double integral that represents its area.

**Solution**

We can either integrate with respect to (wrt) \( x \) first, or wrt \( y \) first. Either approach will let us express the area with one double integral.

Integrating wrt \( y \) first: the region of integration is the set of all points, \((x, y)\), such that \( 0 \leq x \leq 1 \), and \( x^3 \leq y \leq \sqrt{x} \). A double integral that represents the area of the region is

\[
\int_0^1 \int_{x^3}^{\sqrt{x}} dy \, dx.
\]

Alternatively, integrating wrt \( x \) first, we can express the region of integration as the set of all points, \((x, y)\), such that \( 0 \leq y \leq 1 \), and \( y^2 \leq x \leq y^{1/3} \). A double integral that represents the area of the region is

\[
\int_0^1 \int_{y^2}^{y^{1/3}} dx \, dy.
\]
1b) Area of a Region

Sketch the region bounded by $x = 5 - y$, $x = 2y - 1$, $y = 1$, and construct a double integral that represents its area.

Solution

The shape of the region suggests that if we integrate wrt $x$ first, then we can express the area with a single integral.

The region of integration is the set of all points, $(x, y)$, such that $1 \leq y \leq 2$, and $2y - 1 \leq x \leq 5 - y$. A double integral that represents the area of the region is

$$\int_{1}^{2} \int_{2y-1}^{5-y} dx \, dy.$$ 

Alternatively, we could also integrate wrt $y$ first. This approach would require two integrals,

$$\int_{1}^{3} \int_{1}^{\frac{x+1}{2}} dy \, dx + \int_{3}^{4} \int_{1}^{5-x} dy \, dx.$$
1c) Area of a Region

Sketch the region bounded by \( y = x - 6 \), \( y^2 = x \), and construct a double integral that represents its area.

**Solution**

Finding the intersection points requires solving \( y^2 = y + 6 \), which yields \( y = -2 \) and \( y = 3 \).

The shape of the region suggests that we integrate wrt \( x \) first. A double integral that represents the area of the region is

\[
\int_{-2}^{3} \int_{y^2}^{y+6} dx 
\]

Alternatively, we could also integrate wrt \( y \) first. It would require two integrals,

\[
\int_{0}^{4} \int_{-\sqrt{x}}^{\sqrt{x}} dy 
+ \int_{4}^{9} \int_{1}^{5-x} dy.
\]
Recitation 18

R18 Topics
15.2 Double Integrals over General Regions
15.3 Area by Double Integration

R18 Learning Objectives
▶ Construct a double integral that represents the area of a region bounded by a set of given curves in Cartesian coordinates.
▶ Change the order of integration of a double integral.
▶ Calculate the average value of a function of two variables.

Today’s Questions
1. Change the order of integration.
   a) \( \int_{-1}^{0} \int_{-\sqrt{y+1}}^{\sqrt{y+1}} \, dx \, dy \)
   b) \( \int_{2}^{1+e} \int_{0}^{\ln(x-1)} f(x, y) \, dy \, dx \)

2. Construct a double integral that represents the volume of the solid enclosed by the cylinder \( x^2 + y^2 = 1 \), the planes \( z = y, \, x = 0, \, z = 0 \), in the first octant.
3. Evaluate \( \int_{0}^{4} \int_{y}^{4} e^{x^2} \, dx \, dy \).
Announcements

**GRA3, Next Tuesday (5 points)**
Suppose we wanted to locate all the minimums and maximums of $x^2 y^2$ subject to $(x^2 + y^2)^2 + xy^2 = 1$. Reduce this problem to the problem of solving three equations in three unknowns. Do not solve the equations you derive.

**Quiz 3: Next Thursday**
Quiz 3 may cover 14.8 to 14.10, and 15.1 to 15.4. We’ll see.
The Average Value of a Function (15.3)

The average value of a function, \( f(x, y) \), over a region \( R \), is given by

\[
\text{Average value of } f \text{ over region } R = \frac{1}{\text{area of } R} \iint_R f(x, y) \, dA
\]

This definition can be used to find the value of some double integrals quickly.

**Example**
Region \( R \) is the unit circle \( \sqrt{x^2 + y^2} \leq 1 \). The definite integral of \( f = x + 1 \) over \( R \) is equal to:

a) 0  
b) 1  
c) \( \pi \)  
d) \( \pi/4 \)

**Solution**
The answer is c). The area of \( R \) is \( \pi \). The average value of \( 1 + x \) over \( R \) is 1.

\[
1 = \frac{1}{\pi} \iint_R (1 + x) \, dA \quad \Rightarrow \quad \iint_R (1 + x) \, dA = \pi.
\]

Calculating this double integral by hand would have required many more steps.
Conceptual Question Related to Double Integrals

Let region $R$ be the square $-1 \leq x \leq 1, -1 \leq y \leq 1$. The definite integral of $x^3$ over region $R$ is equal to:

a) a positive number  
b) a negative number  
c) zero  
d) a function of $x$

Solution

The answer is zero because the average value of $f$ over $R$ is zero. Alternatively, we can also argue that the double integral is zero because we are integrating an odd function (in $x$) over an interval that is symmetric about the $y$-axis.

Calculating the integral may help explain what this means.

$$
\int_{-1}^{1} \int_{-1}^{1} x^3 \, dx \, dy = \int_{-1}^{1} \frac{x^4}{4} \bigg|_{-1}^{1} \, dy = \int_{-1}^{1} 0 \, dy = 0.
$$

You may remember from integral calculus that for a function of one variable, the integral of an odd function over a symmetric interval is zero.
1a) Changing the Order of Integration

Change the order of integration.
\[
\int_{-1}^{0} \int_{-\sqrt{y+1}}^{\sqrt{y+1}} \, dx \, dy
\]

Solution
The inner integral tells us that \( x \in [-\sqrt{y+1}, \sqrt{y+1}] \). We can solve for \( y \) to more easily sketch the region of integration.

\[-\sqrt{y+1} \leq x \leq \sqrt{y+1}\]
\[x^2 \leq y + 1\]
\[y \geq x^2 - 1\]

The above inequality tells us that we are interested in the region above the parabola \( y = x^2 - 1 \). The outer integral tells us that \(-1 \leq y \leq 0\), so we are only interested in the region between \( y = x^2 - 1 \) and the \( x \)-axis. The rest of this problem is on the next slide.
Integrating wrt \( y \) first requires \( y \in [x^2 - 1, 0] \), and \( x \in [-1, 1] \). The integral becomes

\[
\int_{-1}^{0} \int_{-\sqrt{y+1}}^{\sqrt{y+1}} \, dx \, dy = \int_{-1}^{1} \int_{0}^{x^2 - 1} \, dy \, dx
\]
1b) Changing the Order of Integration

Change the order of integration.

\[ \int_2^{1+e} \int_0^{\ln(x-1)} f(x, y) \, dy \, dx \]

**Solution**

The region over which we are integrating \( f(x, y) \) is the shaded area below.

The region is bounded by the lines \( y = 0 \), \( x = 1 + e \), and by the curve \( y = \ln(x - 1) \). Integrating wrt \( y \) last, values of \( y \) range from 0 to 1, and values of \( x \) range from \( x = e^y + 1 \) to \( x = 1 + e \). The double integral becomes

\[ \int_0^{1} \int_{e^y + 1}^{1+e} f(x, y) \, dx \, dy. \]
2) Volume of a Solid

Construct a double integral that represents the volume of the solid enclosed by the cylinder $x^2 + y^2 = 1$, the planes $z = 1 - y$, $x = 0$, $z = 0$, in the first octant.

**Solution**

The solid lies under the surface $z = 1 - y$ and above the quarter circle $R$, with $0 \leq x \leq 1$, $0 \leq y \leq \sqrt{1 - x^2}$.

\[
V = \iint_R f(x, y) \, dA = \int_0^1 \int_0^{\sqrt{1-x^2}} (1-y) \, dy \, dx
\]

Alternatively, we could also integrate with respect to $x$ first.

\[
V = \iint_R f(x, y) \, dA = \int_0^1 \int_0^{\sqrt{1-y^2}} (1-y) \, dx \, dy
\]

In case it helps, sketches of region $R$ and the solid are below.
3) Evaluating a Double Integral

Evaluate the following double integral.

\[ \int_0^4 \int_y^4 e^{x^2} \, dx \, dy \]

Solution

The integral of \( e^{x^2} \) cannot be expressed in terms of elementary functions. What can we do to get around this problem?

The given integration region is bounded by the lines \( y = 0 \), \( x = 4 \), and \( y = x \). Changing the order of integration, the double integral becomes

\[
\int_0^4 \int_y^4 e^{x^2} \, dx \, dy = \int_0^4 \int_0^x e^{x^2} \, dy \, dx \\
= \int_0^4 ye^{x^2} \bigg|_{y=0}^{y=x} \, dx \\
= \int_0^4 xe^{x^2} \, dx = \frac{e^{x^2}}{2} \bigg|_0^4 = \frac{e^{16} - 1}{2}
\]

Changing the order of integration can sometimes make it easier to evaluate certain integrals.
Additional Exercises

1. Set up an integral that represents the volume of the solid enclosed by the planes \( x = 1, \ y = 3, \) the three coordinate planes, and \( x^2 + 2y^2 + z = 1. \)

2. Find the volume of the solid enclosed by \( z = x^2 + y^2, \ y = x^2, \) and \( x = y^2. \)

Solution

1. The solid lies under the surface \( z = 1 - x^2 - 2y^2 \) and above the rectangle \( R, \) with \( 0 \leq x \leq 1, \ 0 \leq y \leq 3. \)

\[
\int \int_R f(x, y) \, dA = \int_{0}^{1} \int_{0}^{3} (1 - x^2 - 2y^2) \, dy \, dx
\]

2. The curves \( y = x^2 \) and \( x^2 = y \) intersect at \((0, 0)\) and at \((1, 1)\).

\[
\int_{0}^{1} \int_{x^2}^{\sqrt{x}} x^2 + y^2 \, dy \, dx = \int_{0}^{1} \left( yx^2 + \frac{y^3}{3} \right) \bigg|_{x^2}^{\sqrt{x}} \, dx
\]

\[
= \int_{0}^{1} \left( x^{5/2} + \frac{x^{3/2}}{3} - x^4 - \frac{x^6}{3} \right) \, dx
\]

\[
= \left( \frac{2}{7}x^{7/2} + \frac{2}{15}x^{5/2} - \frac{1}{5}x^5 - \frac{1}{21}x^7 \right) \bigg|_{0}^{1}
\]

\[
= \frac{2}{7} + \frac{2}{15} - \frac{1}{5} - \frac{1}{21} = 6/35
\]

I’ll hold additional office hours and a review session:
- Quiz 3 Review Session ∀ Math 2401 students: Tue 5:30 - 7:00 pm, at https://georgiatech.adobeconnect.com/dcp-online-drop-in-tutor-center-2014-fall
- Quiz 3 Review Session ∀ QH8 students: Wed: 7:30 - 8:30 pm at https://georgiatech.adobeconnect.com/distancecalculusofficehours
Quiz 3 Learning Objectives

You should be able to do the following for Quiz 3.

▶ Solve constrained optimization problems using Lagrange multipliers (14.8).
▶ Calculate a Taylor approximation to a function of two variables at a point (14.9).
▶ Apply the chain rule to compute partial derivatives with intermediate variables (14.10).
▶ Construct a double integral that represents the area of a region bounded by a set of given curves in Cartesian or polar coordinates (15.1 to 15.4).
▶ Change the order of integration of a double integral (15.1 to 15.4).
▶ Calculate the average value of a function of two variables (15.3).
Volume of a Sphere

Identify the expressions that represent the volume of a sphere of radius R.

1) \( 4 \int_0^\pi \int_0^R r \sqrt{R^2 - r^2} \, dr \, d\theta \)

2) \( \int_0^{2\pi} \int_0^R \sqrt{R^2 - r^2} \, dr \, d\theta \)

3) \( 2 \int_0^{2\pi} \int_0^R r \sqrt{R^2 - r^2} \, dr \, d\theta \)

4) \( \int_0^{2\pi} \int_0^{R/2} r \sqrt{R^2 - r^2} \, dr \, d\theta \)

Solution: (1) and (3) are correct. In Cartesian coordinates, the volume of the sphere is

\[
2 \int_0^R \int_{-\sqrt{R^2-x^2}}^{\sqrt{R^2-x^2}} \sqrt{R^2-(x^2+y^2)} \, dy \, dx
\]

We multiply by 2 because the integral only represents the upper half of the sphere, whose height from the xy-plane is \( R^2 - (x^2 + y^2) \). We must convert this integral from Cartesian to polar coordinates.
Volume of a Sphere (continued)

We need to do three things: convert the integrand to polar coordinates, identify the limits of integration, and change the differential (dxdy) to a polar representation, $r dr d\theta$.

Knowing that $x^2 + y^2 = r^2$, the integrand becomes $\sqrt{R^2 - r^2}$.

The projection of the volume onto the $xy$-plane is a circle of radius $R$, centered at the origin. So the points in the region have polar coordinates $(r, \theta)$ in the set $0 \leq \theta \leq 2\pi$, and $0 \leq r \leq R$.

Using these limits of integration our integral becomes

$$2 \int_0^{2\pi} \int_0^R r \sqrt{R^2 - r^2} r dr d\theta$$

Alternatively, we can use symmetry and use the limits $0 \leq \theta \leq \pi$, and $0 \leq r \leq R$, so the integral becomes

$$4 \int_0^\pi \int_0^R r \sqrt{R^2 - r^2} r dr d\theta$$
Graded Recitation Activity 3

Instructions

▶ Every student in your group needs to write their name or initials on the board.
▶ You have 10 minutes to answer the question below.
▶ For full marks, show at least one intermediate step.
▶ All students in the same group receive the same grade.
▶ Please do not share computers: every student should log in on their own computer.
▶ You do not need to simplify your answers.

Question (5 points, from last year’s quiz)
Suppose we wanted to locate all the minimums and maximums of $x^2y^2$ subject to $(x^2 + y^2)^2 + xy^2 = 1$. Reduce this problem to the problem of solving three equations in three unknowns. Do not solve the equations you derive.
Suppose we wanted to locate all the minimums and maximums of $x^2y^2$ subject to $(x^2 + y^2)^2 + xy^2 = 1$. Reduce this problem to the problem of solving three equations in three unknowns. Do not solve the equations you derive.

**Solution:** a screen capture of hand-written solutions are below.

\[
\begin{align*}
\text{Let } f(x,y) &= x^2y^2, \\
\text{Let } g(x,y) &= (x^2 + y^2)^2 + xy^2 - 1. \\
\end{align*}
\]

Min and max occur at the solutions to:

\[
\begin{align*}
\nabla f &= \lambda \nabla g, \\
\begin{bmatrix}
2xy^2 \\
2y^2 \\
2x^2y
\end{bmatrix}
 &= \lambda
\begin{bmatrix}
2(x^2 + y^2)x + y^2 \\
2(x^2 + y^2)y + 2xy \\
2x^2y
\end{bmatrix}
\end{align*}
\]

Our three equations are

\[
\begin{align*}
2xy^2 &= \lambda \left[ 4x(x^2 + y^2) + y^2 \right], \\
2x^2y &= \lambda \left[ 4y(x^2 + y^2) + 2xy \right], \\
(x^2 + y^2)^2 + xy^2 &= 1.
\end{align*}
\]
Converting Double Integral to Polar Coordinates

Convert to a double integral in polar coordinates (from 2014 Quiz 2).

\[ \int_0^2 \int_0^{\sqrt{4-(x-2)^2}} xy \, dy \, dx \]

**Solution:** the 1st part of a screen capture of hand-written solutions are below.

Recitation 19, Slide 7
Converting Double Integral to Polar Coordinates (continued)

**Solution:** the 2nd part of a screen capture of hand-written solutions are below.

![Diagram of a circle with annotations](image)

We are only looking at quarter of a circle because \( x \in [0, 2] \).

\( \theta \in [0, \frac{\pi}{2}] \)

We only need
Converting Double Integral to Polar Coordinates (continued)

**Solution:** the 3rd part of a screen capture of hand-written solutions are below.

\[
\begin{align*}
\theta &\in [0, \frac{\pi}{4}] \\
r &\in [0, \frac{2}{\cos \theta}] \\
\theta &\in [\frac{\pi}{4}, \frac{\pi}{2}] \\
r &\in [0, 4 \cos \theta]
\end{align*}
\]
Converting Double Integral to Polar Coordinates (continued)

**Solution:** the 4th part of a screen capture of hand-written solutions are below.

\[ \int_0^2 \int_0^{\sqrt{4-(x-2)^2}} xy \, dy \, dx = \int_0^{\frac{\pi}{4}} \int_0^{2 \sec \theta} \sin \theta \cos \theta \, r^2 \, dr \, d\theta \]

\[ + \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \int_0^4 \sin \theta \cos \theta \, r^2 \, dr \, d\theta \]
Additional Exercise: Normal Distribution

Evaluate

\[ I = \int_0^\infty e^{-x^2} \, dx \]

Solution

\[ I^2 = \int_0^\infty e^{-x^2} \, dx \cdot \int_0^\infty e^{-y^2} \, dy \]

\[ = \int_0^\infty \int_0^\infty e^{-x^2-y^2} \, dx \, dy \]

\[ = \lim_{a \to \infty} \int_0^{\pi/2} \int_0^a r e^{-r^2} \, dr \, d\theta \]

\[ = \lim_{a \to \infty} \int_0^{\pi/2} \frac{-1}{2} e^{-r^2} \bigg|_0^a \, d\theta \]

\[ = \frac{-1}{2} \lim_{a \to \infty} \int_0^{\pi/2} (e^{-a^2} - 1) \, d\theta \]

\[ I^2 = \pi/4 \]

\[ I = \sqrt{\pi/4} \]
Additional Exercise: Integration in Polar Coordinates

Sketch the rose curve $r = 2 \cos(2\theta)$ and find the area of one petal.

Solution: a screen capture of hand-written solutions are below.

Sketch the petal curve $r = 2\cos(2\theta)$ and find the area of one petal.

\[
\text{Area} = 2 \int_{\frac{\pi}{4}}^{\pi} \int_{0}^{2\cos(2\theta)} r \, dr \, d\theta
\]

\[
= 2 \int_{\frac{\pi}{4}}^{\pi} \left( \frac{1}{4} \right) (2\cos(2\theta))^2 \, d\theta
\]

\[
= \frac{\pi}{4} \left( \theta + \frac{\sin(4\theta)}{4} \right) \Bigg|_{\frac{\pi}{4}}^{\pi}
\]

\[
= \frac{\pi}{4} \left( \pi - 0 \right) = \frac{\pi^2}{4}
\]

R23 Topics
15.5 Triple Integrals in Rectangular Coordinates
15.6 Moments of Inertia and Mass

R23 Learning Objectives
▶ Construct a triple integral that represents the area of a region bounded by a set of given curves in Cartesian or cylindrical coordinates
▶ Change the order of integration of a triple integral
▶ Set-up integrals that represent moments of inertia and centres of mass of solids

Today’s Questions
1. Set-up a triple integral that represents the volume bounded by the following surfaces. Set-up the integrals in at least two different ways.
   1.1 $y^2 + z^2 = 1$, and the planes $y = x$, $x = 0$, and $z = 0$.
   1.2 $z^2 = y$, and the planes $y + z = 2$, $x = 0$, $x = 2$, and $z = 0$.

2. Consider the region inside the curve $r = 2 + \sin(\theta)$. Set up the three integrals you need to find the $x$ and $y$ coordinates of the centroid of the region, assuming its density is $\delta(x, y)$. Express these integrals in polar coordinates. This is a question from a 2014 quiz.
Graded Recitation Activity 4: Next Tuesday

Instructions (same as before)
- Every student in your group needs to write their name or initials on the board.
- You have 15 minutes to answer both questions below.
- For full marks, show at least two intermediate steps.
- All students in the same group receive the same grade.
- Please do not share computers: every student should log in on their own computer.
- You do not need to simplify your answers.

Questions (5 points each, both questions are from old quizzes)

1. Set-up a triple integral that represents the volume of the ellipsoid
   \[ x^2 + \left(\frac{y}{2}\right)^2 + \left(\frac{z}{9}\right)^2 = 1 \]
   in the 1st octant \((x,y,z)\) non-negative). Do not evaluate.

2. Set-up a triple integral that represents the volume of the solid bounded by
   the hyperboloid of two sheets \(-x^2 - y^2 + z^2 = 4\), the plane \(z = 8\) and the plane \(z = 10\). Do not evaluate.
Triple Integrals, Example 1

Set-up a triple integral that represents the volume of the region bounded by $y^2 + z^2 = 1$, and the planes $y = x$, $x = 0$, and $z = 0$. Set-up the integral in at least two different ways.

Solution: $dzdydx$

We could choose the integration order $dzdydx$. The solid is shown below.

We chose to integrate wrt $x$ last, so $x \in [0, 1]$.

Then, for any given value of $x$ in $[0, 1]$, $y \in [x, 1]$.

Then, for any $y \in [x, 1]$, $z \in [0, \sqrt{1 - y^2}]$.

The volume of the solid, $V$, is equal to the triple integral

$$V = \int_0^1 \int_x^1 \int_0^{\sqrt{1-y^2}} dzdydx.$$
Solution: $dxdzdy$

We could also use the integration order $dxdzdy$. We decided to integrate wrt $y$ last, so $y \in [0, 1]$. Then, for any given value of $y$ in $[0, 1]$, $z \in [0, \sqrt{1 - y^2}]$. Then, for any $z \in [0, \sqrt{1 - y^2}]$, $x \in [0, 2]$. The volume is the triple integral:

$$V = \int_0^1 \int_0^{\sqrt{1-y^2}} \int_0^y dxdzdy$$

Note:

- Using only Cartesian coordinates, there are six integration orders that can be considered ($dxdydz$, $dxdzdy$, $dydxdz$, $dydzdx$, $dzdxdy$, $dzdydx$).
- Regardless of how we set up our integral, we should obtain the same value for $V$, which in this case happens to be $1/3$.
- WolframAlpha syntax for evaluating the above triple integral is

$$\int_0^1 \int_0^{\sqrt{1-y^2}} \int_0^y dxdzdy$$
**Triple Integrals, Example 2**

Set-up a triple integral that represents the volume of the region bounded by \( z^2 = y \), and the planes \( y + z = 2 \), \( x = 0 \), \( x = 2 \), and \( z = 0 \). Set-up the integral in at least two different ways.

**Solution**

If we were to choose \( dzdydx \), then we would need to break up our volume into two regions. The curves \( z = 2 - y \) and \( z = y^2 \) are shown below, along with regions R1 and R2.
Volume of Region R1 with $dz\,dy\,dx$
We chose to integrate wrt $x$ last, so $x \in [0, 2]$.
Then, for any given value of $x$ in $[0,2]$, $y \in [0, 1]$.
Then, for any $y \in [0,1]$, $z \in [0, \sqrt{y}]$.

Volume Region R2 with $dz\,dy\,dx$
We chose to integrate wrt $x$ last, so $x \in [0, 2]$.
Then, for any $x$ in $[0, 2]$, $y \in [1,2]$.
Then, for any $y \in [1,2]$, $z \in [0, 2-y]$.

Thus, the total volume is the sum of the two triple integrals:

$$V = \iiint_{R_1} dV + \iiint_{R_2} dV$$

$$= \int_0^2 \int_0^1 \int_0^{\sqrt{y}} dz\,dy\,dx + \int_0^2 \int_1^2 \int_0^{2-y} dz\,dy\,dx$$
Solution: $dydzdx$

With the integration order $dydzdx$, we do not need to break up the solid into two regions. We are integrating wrt $x$ last, so $x \in [0, 2]$.

Then, for any $x$ in $[0, 2]$, $z \in [0, 1]$.

Then, for any $z \in [0, 1]$, $y \in [z^2, 2 - z]$.

Thus, the total volume is the triple integral:

$$V = \int_0^2 \int_0^1 \int_{z^2}^{2-z} dydzdx$$

Note:

- Regardless of how we set up our integral, we should obtain the same value for $V$, which in this case happens to be $7/3$.

- WolframAlpha syntax for evaluating the above triple integral is

$$\int_0^2 \int_0^1 \int_{z^2}^{2-z} dydzdx$$
Centroid

Consider the region inside the curve \( r = 2 + \sin(\theta) \). Set up the three integrals you need to find the \( x \) and \( y \) coordinates of the centroid of the region, assuming its density is \( \delta(x, y) \). Express these integrals in polar coordinates.

This is a question from a 2014 quiz.

Solution

A plot of the curve is shown below.

The mass of the solid, \( m \), is

\[
m = \int_0^{2\pi} \int_0^{2+\sin(\theta)} \delta(r, \theta) \, r \, dr \, d\theta
\]

The coordinates \((\bar{x}, \bar{y})\) of the center of mass of the region are

\[
m\bar{x} = \int_0^{2\pi} \int_0^{2+\sin(\theta)} \delta(r, \theta) \, r^2 \cos(\theta) \, dr \, d\theta
\]

\[
m\bar{y} = \int_0^{2\pi} \int_0^{2+\sin(\theta)} \delta(r, \theta) \, r^2 \sin(\theta) \, dr \, d\theta
\]
Recitation 24

R24 Topics
15.7 Integration in Cylindrical and Spherical Coordinates

R24 Learning Objectives

- Construct a triple integral that represents the area of a region bounded by a set of given curves in cylindrical or spherical coordinates
- Change the order of integration of a triple integral

The Spherical Coordinate System

Fill in the blanks.

\[ x = \rho \cos \theta \]  
\[ y = \rho \sin \theta \]  
\[ z = \rho \]
Graded Recitation Activity 4: Next Tuesday

Instructions (same as before)

- Every student in your group needs to write their name or initials on the board.
- You have 15 minutes to answer both questions below.
- For full marks, show at least **two intermediate steps**.
- All students in the same group receive the same grade.
- Please do not share computers: every student should log in on their own computer.
- You do not need to simplify your answers.

Questions (5 points each, both questions are from old quizzes)

1. Set-up a triple integral that represents the volume of the ellipsoid $x^2 + (y/2)^2 + (z/9)^2 = 1$ in the 1st octant ($x,y,z$ non-negative). Do not evaluate.

2. Set-up a triple integral that represents the volume of the solid bounded by the hyperboloid of two sheets $-x^2 - y^2 + z^2 = 4$, the plane $z = 8$ and the plane $z = 10$. Do not evaluate.
Spherical Coordinates

Provide a geometric interpretation the surfaces $\rho \sin \phi = 1$ and $\rho \cos \phi = 1$.

Solution: Below is a screen capture of a previous year's handwritten notes.

Fill in the blanks.

1. $x = \rho \cos \theta \underline{\sin \phi}$
2. $y = \rho \sin \theta \underline{\sin \phi}$
3. $z = \rho \underline{\cos \phi}$

$\rho = \sqrt{x^2+y^2+z^2}$, $\tan \theta = y/x$, $\cos \phi = \frac{z}{\sqrt{x^2+y^2+z^2}}$

Provide a geometric interpretation of each expression.

a) $\rho \sin \phi = 1$,

$x^2 + y^2 = \rho^2 \sin^2 \phi \left(\cos^2 \theta + \sin^2 \theta\right) = \rho^2 \sin^2 \phi$. But $\sin^2 \phi = 1$, so $x^2 + y^2 = 1 \Rightarrow$ cylinder radius 1.

b) $\rho \cos \phi = 1 \Rightarrow$ the plane $z = 1$, from $\underline{3}$

The $xy$-plane in spherical coord. is $\phi = \frac{\pi}{2}$, from $\underline{3}$

(because we need the value of $\phi$ that sets $z = 0$)
1) A Triple Integral in Cylindrical Coordinates

Use cylindrical coordinates to set-up an integral that represents the volume of the solid bounded by \( x^2 + y^2 + z^2 = 1 \), and \( z^2 = 3(x^2 + y^2) \).

Solution: Below is a screen capture of a previous year’s handwritten notes.

---

The sphere and cone intersect on:

\[ z^2 = 1 - x^2 - y^2 = 3(x^2 + y^2) \]

\[ 1 - r^2 = 3r^2 \]

\[ r = \frac{1}{2}, \]

\[ \Rightarrow \text{surfaces intersect when } r = \frac{1}{2}, \text{ and when } z^2 = 3\left(\frac{1}{4}\right)^2 = \frac{3}{4}, \text{ or when } z = \sqrt{3}/2. \]

\( \text{we don’t really need } z\text{-coordinate}\)

Use \( dz \, dr \, d\theta \)

\( \theta \in [0, 2\pi] \)

\( r \in [0, \frac{1}{2}] \)

\( z \in [\sqrt{3}r, \sqrt{1-r^2}] \)

\[ V = \int_0^{2\pi} \int_0^{1/2} \int_{\sqrt{3}r}^{\sqrt{1-r^2}} r \, dz \, dr \, d\theta \]

If interested,

\[ V = \frac{\pi}{3}(2 - \sqrt{3}) \]
2) A Triple Integral in Spherical Coordinates

Use spherical coordinates to set-up an integral that represents the volume of the solid bounded by $z = 0$, $x^2 + y^2 = 4$, and $z = 2\sqrt{x^2 + y^2}$.

**Solution:** *Below is a screen capture of a previous year’s handwritten notes.*
Quiz 4 Learning Objectives

▶ Construct a triple integral that represents the area or volume of a region in Cartesian, polar, cylindrical, or spherical coordinates
▶ Change the order of integration, or coordinate system, for a triple integral
▶ Construct integrals that represent moments of inertia and centres of mass
▶ Identify a suitable transformation for a triple integral, and use that transform to find the area or volume of a given region

GRA4

1. Set-up a triple integral that represents the volume of the ellipsoid $x^2 + (y/2)^2 + (z/9)^2 = 1$ in the 1st octant ($x,y,z$ non-negative). Do not evaluate.

2. Set-up a triple integral that represents the volume of the solid bounded by the hyperboloid of two sheets $-x^2 - y^2 + z^2 = 4$, the plane $z = 8$ and the plane $z = 10$. Do not evaluate.
Graded Recitation Activity 4

Instructions (same as before)

▶ Every student in your group needs to write their name or initials on the board.
▶ You have 15 minutes to answer both questions below.
▶ For full marks, show at least two intermediate steps.
▶ All students in the same group receive the same grade.
▶ Please do not share computers: every student should log in on their own computer.
▶ You do not need to simplify your answers.

Questions (5 points each, both questions are from old quizzes)

1. Set-up a triple integral that represents the volume of the ellipsoid 
\[ x^2 + \left(\frac{y}{2}\right)^2 + \left(\frac{z}{9}\right)^2 = 1 \]
   in the 1st octant (x,y,z non-negative). Do not evaluate.

2. Set-up a triple integral that represents the volume of the solid bounded by
   the hyperboloid of two sheets 
   \[-x^2 - y^2 + z^2 = 4, \text{ the plane } z = 8 \text{ and the plane } z = 10.\]
   Do not evaluate.
Set-up a triple integral that represents the volume of the ellipsoid
\[ x^2 + \left(\frac{y}{2}\right)^2 + \left(\frac{z}{9}\right)^2 = 1 \]
in the 1st octant (x,y,z non-negative). Do not evaluate.

**Solution:** Let \( u = x \), \( 2v = y \), \( 9w = z \), then \( J = 18 \), and we are integrating over the unit sphere in the 1st quadrant. From here, we can use Cartesian, cylindrical, or spherical coordinates. Using spherical coordinates, we have:

\[
V = \int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 18\rho^2 \sin \phi d\rho d\phi d\theta
\]

But there are other ways to set this integral up without using a uvw transformation. In Cartesian, we could use the following.

\[
V = \int_0^1 \int_0^{2\sqrt{1-x^2}} \int_0^{9\sqrt{1-x^2-y^2/4}} dz dy dx
\]

The value of the integral is \( 3\pi \). WolframAlpha syntax for the above integrals are:

\[
\int_0^{1} \int_0^{2\sqrt{1-x^2}} \int_0^{9\sqrt{1-x^2-y^2/4}} dz \ dy \ dx
\]

\[
\int_0^{\pi/2} \int_0^{\pi/2} \int_0^1 18\rho^2 \sin(\phi) \ d\rho \ d\phi \ d\theta
\]
Set-up a triple integral that represents the volume of the solid bounded by the hyperboloid of two sheets $-x^2 - y^2 + z^2 = 4$, the plane $z = 8$ and the plane $z = 10$. Do not evaluate.

**Solution:** Below is a screen capture of a previous year’s handwritten notes.
Change of Variables

- After completing HW 15.8, you might be familiar with computing an integral, if you are given a transform.
- But if we were given an integral over a complicated region, and were not given a suitable transform, how could we find one?
- The basic idea is to find a transform that converts a complicated region into a simple one, such as a square, or a circle
1) Change of Variables

Show that the area of the ellipse \((x/a)^2 + (y/b)^2 = 1\) is \(\pi ab\).

**Solution:** let \(u = x/a\), and \(v = y/b\), so that we are integrating over the unit circle, \(u^2 + v^2 = 1\). We can show that \(|J| = ab\), and the area, \(A\), becomes

\[
A = 4 \int_0^1 \int_0^{\sqrt{1-u^2}} abdvdu
\]

Now let \(u = r \cos \theta\) and \(v = r \sin \theta\).

\[
A = 4ab \int_0^{\pi/2} \int_0^1 r dr d\theta
\]

\[
= 4ab \int_0^{\pi/2} \frac{1}{2} r^2 \bigg|_0^1 d\theta
\]

\[
= 2ab \int_0^{\pi/2} d\theta
\]

\[
= 2ab \frac{\pi}{2}
\]

\[
= \pi ab
\]
2) Change of Variables

Set-up an integral that represents the area of a region bounded by $x + y = 0$, $x + y = 1$, $x - y = 0$, $x - y = 2$.

**Solution:** The appearance of the terms $(x + y)$ and $(x - y)$ in the integrand and in the lines that bound $R$ suggests the transformation

$$u = x + y \quad (1)$$

$$v = x - y. \quad (2)$$

In order to compute the Jacobian, we need explicit expressions for $u$ and $v$. If we add equations 1 and 2 we find that $x = \frac{u+v}{2}$. If we subtract equations 1 and 2 we find that $y = \frac{u-v}{2}$. The Jacobian becomes

$$J = \begin{vmatrix} \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & -\frac{1}{2} \end{vmatrix} = -\frac{1}{4} - \frac{1}{4} = -\frac{1}{2}.$$

We also need to find the limits of integration in the transformed integral. Using equations 1 and 2 the four lines bounding $R$ in the $xy$-plane become

$$u = 0, \quad u = 1, \quad v = 0, \quad v = 1.$$

The solution is continued on the next slide.
2) Change of Variables (continued)

The double integral therefore becomes

$$\int \int_R (x^2 - y^2) \, dx \, dy = \int \int_R (x - y)(x + y) \, dx \, dy$$

$$= \int_0^1 \int_0^1 uv \, dudv - \frac{1}{2} \left| \int_0^1 \int_0^1 (uv) \, dudv \right|$$

We did not need to evaluate the integral, but this works out to be 1/8.
3) Triple Integrals

Set-up a triple integral that represents the volume of the solid bounded by

\[0 \leq x \leq 1, \quad 0 \leq y \leq \sqrt{1 - x^2}, \quad \text{and} \quad \sqrt{x^2 + y^2} \leq z \leq \sqrt{2 - (x^2 + y^2)}.\]

**Solution:** Below is a screen capture of a previous year’s handwritten notes.

Set-up an integral that represents the volume of the solid bounded by

\[0 \leq x \leq 1\]
\[0 \leq y \leq \sqrt{1 - x^2}\]
\[\sqrt{x^2 + y^2} \leq z \leq \sqrt{2 - (x^2 + y^2)}\]

\[\ell_{\text{INTEGRATION LIMITS}}\]
\[\phi \in [0, \frac{\pi}{2}]\]
\[\theta \in [0, \frac{\pi}{2}]\]

\[V = \int_0^{\sqrt{2}} \int_0^\pi \int_0^{\sqrt{2}} r^2 \sin \theta \, dr \, d\theta \, d\phi = \frac{\sqrt{2}}{6} \pi \left(2 - \sqrt{2}\right)\]

(Note: solid is a “quarter” of an ice-cream cone)
4) Cylindrical

Set-up a triple integral that represents the volume of the solid bounded by \( z = x^2 + y^2 \), and the plane \( y = z \). Use cylindrical coordinates.

**Solution:** Below is a screen capture of a previous year’s handwritten notes.
5) Triple Integral

Set-up a triple integral that represents the volume of the solid bounded by 
\(1 = x^2 + y^2\), above \(x^2 + y^2 + 4z^2 = 36\), and below by \(z = 1\).

**Solution:** Below is a screen capture of a previous year’s handwritten notes.

Let me know if you catch any typos in the above.
5) Triple Integral (Alternate Solution)

Set-up a triple integral that represents the volume of the solid bounded by \( 1 = x^2 + y^2 \), above \( x^2 + y^2 + 4z^2 = 36 \), and below by \( z = 1 \).

**Solution:** Below is a screen capture of a previous year’s handwritten notes.

Set up an integral that represents the volume of solid bounded by \( x^2 + y^2 = 1 \), \( x^2 + y^2 = 4 \), above by \( x^2 + y^2 + 4z^2 = 36 \), and below by \( z = 1 \).

Another approach: polar/cylindrical.

\[
V = \int_0^{2\pi} \int_1^2 \int_1^{\sqrt{36/4 - r^2 (x^2+y^2)^2}} r\,dz\,dr\,d\theta
\]

In the above, for the upper limit of the innermost integral, we should have used \( r^2 \), rather than \( x^2 + y^2 \).
Recitation 27

Today's Topics
- 16.1 Line Integrals (brief review)
- 16.2 Vector Fields and Line Integrals, Work, Circulation, Flux

Learning Objectives
- 16.1 Set-up and evaluate a line integral to calculate the mass of a thin wire
- 16.2 Set-up and evaluate a line integral that represents total work
16.1: Mass of a Thin Wire (a review of lecture material?)

**How To Calculate Mass of a Wire**
- position on wire given by parameterization, $\vec{r}(t)$
- density of wire is $\delta = \delta(r(t))$
- length of a small piece of wire is $\Delta s(r(t_k))$
- we can approximate the total mass with:

$$M \approx \sum \delta(r(t_k)) \Delta s(r(t_k))$$

In the limit as $\Delta s$ tends to zero,

$$M = \int_C \delta ds$$

To compute total mass, we can show that:

$$M = \int_{a}^{b} \delta(r) |\vec{r}'| dt$$
16.1: Mass of a Thin Wire

Compute the total mass of a wire whose density is given by \( \delta = 3x^2 - 2y \), and whose shape is given by the line segment from the origin to the point (2,4).

\[
\overrightarrow{r} = t\hat{i} + 2t\hat{j} = \left[ \begin{array}{c} t \\ 2t \end{array} \right], \quad t \in [0, 2], \quad |\overrightarrow{r}'| = \sqrt{5}
\]

\[
\delta = \delta(\overrightarrow{r}) = 3(x(t))^2 - 2y(t) = 3t^2 - 2(2t^2) = t^2
\]

\[
M = \int_0^2 (3t^2 - 2t^2) \sqrt{5} \, dt = \sqrt{5} \frac{8}{3}
\]
16.2: Work (a review of lecture material?)

Work is the energy transferred to or from an object by means of a force acting on the object.

For a wind turbine, \( \vec{F} \) does not act in the direction of motion. Motion in a curve in \( \mathbb{R}^3 \) and \( \vec{F}(t) \) is some parametrization.
16.2: Work Over a Straight Line Path

Force $\mathbf{F}$ is applied to an object as it moves from $x = a$ to $x = b$ along the $x$-axis.

<table>
<thead>
<tr>
<th>Applied Force</th>
<th>Work</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\mathbf{F} = 4\mathbf{i}$</td>
<td>$W = \mathbf{F} \cdot \mathbf{\Delta \mathbf{x}} = 4\mathbf{i} \cdot (b-a)\mathbf{i} = 4(b-a)$</td>
</tr>
<tr>
<td>$\mathbf{F} = 4\mathbf{i} - 2\mathbf{j}$</td>
<td>$W = \mathbf{F} \cdot \mathbf{\Delta \mathbf{x}} = 4\mathbf{i} \cdot (b-a)\mathbf{i} = 4(b-a)$</td>
</tr>
</tbody>
</table>

we need to extend this concept to curved paths in $\mathbb{R}^3$

and work is a scalar, calculated with a dot product.
16.2: Force Over a Curved Path

Force $F$ applied to an object as it moves from $r(u)$ to $r(u + h)$ along curve $C$.

Work done by force $F$ from $r(u)$ to $r(u+h)$ is $W(u + h) - W(u)$.

<table>
<thead>
<tr>
<th>Case 3</th>
<th>Applied Force</th>
<th>Work</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>$F = F(r(u))$</td>
<td>$W(u + h) - W(u) \approx \int F(r(u)) \cdot \frac{F(u+h) - F(u)}{h}$</td>
</tr>
</tbody>
</table>

1. divide both sides by $h$
2. take limit as $h \to 0$: $w' = F(r) \cdot \frac{d}{du}$
3. integrate: $w = \int F(r) \cdot \frac{d}{du} du = \int F \cdot dr$
16.2: Calculating Work

Set up an integral that represents the total work.

a) $\mathbf{F} = (x + 2y)i + (2x + y)j$, path is $y = x^2$ from $(0,0)$ to $(2,4)$.

b) $\mathbf{F} = (x - y) i - xy j$, along the line from $(2,3)$ to $(1,2)$.

c) $\mathbf{F} = xy i - 2j + 4zk$, along the circular helix $\mathbf{r} = \cos(u)i + \sin(u)j + uk$, from $u = 0$ to $u = 2\pi$.

\[ \text{a) Find } \mathbf{F} : \text{ let } x = u, \ y = u^2, \ \mathbf{F} = \left[ \begin{array}{c} \frac{u + 2u^2}{2u + u^2} \\ \frac{u^2}{2} \end{array} \right], \ \mathbf{r} = \left[ \begin{array}{c} u \\ u^2 \end{array} \right], \ \mathbf{r}' = \left[ \begin{array}{c} 1 \\ 2u \end{array} \right] \]

\[ W = \int_0^2 \left[ \begin{array}{c} u + 2u^2 \\ 2u + u^2 \end{array} \right] \cdot \left[ \begin{array}{c} 1 \\ 2u \end{array} \right] \, du = \int_0^2 (u + 2u^2) + (2u + u^2 + 4u^2 + 2u^3) \, du \]

\[ \text{b) } \mathbf{F} = \left[ \begin{array}{c} x - y \\ -xy \end{array} \right] = \left[ \begin{array}{c} -1 \\ -5u + u^2 \end{array} \right] \text{ if } \mathbf{r} = \left[ \begin{array}{c} 2 - u \\ 3 - u \end{array} \right] \text{ and } u \in [0, 1] \]

\[ W = \int_0^1 \left[ \begin{array}{c} -1 \\ 6 - 5u + u^2 \end{array} \right] \cdot \left[ \begin{array}{c} -1 \\ -1 \end{array} \right] \, du = \int_0^1 6 + 5u - u^2 \, du = -\frac{17}{6} \]

\[ \text{c) } W = \int_0^{2\pi} \left[ \begin{array}{c} \cos^2 \frac{\pi}{2} \\ -\sin \frac{\pi}{2} \end{array} \right] \cdot \left[ \begin{array}{c} -\sin \frac{\pi}{2} \\ 4u \end{array} \right] \, du = \int_0^{2\pi} -\cos^2 \frac{\pi}{2} - 2u \, du = 0 + \int_0^{2\pi} 4u \, du = 8\pi^2 \]
Recitation 28

Today's Topics
- 16.2 Vector Fields and Line Integrals, Work, Circulation, Flux
- 16.3 Path Independence

Learning Objectives
16.2 Set-up, evaluate, and interpret integrals to calculate circulation and flux
16.3 Determine whether a vector field is conservative

Circulation
Circulation is a measure of the flow along a curve C, or net velocity along C.

\[
\text{circulation} = \Gamma = \oint_C \vec{v}(\vec{r}) \cdot d\vec{r} = \int_a^b \vec{v}(\vec{r}(t)) \cdot \vec{r}'(t) dt
\]
16.2: Circulation

Sketch the velocity field for \( \mathbf{v} \), and calculate the circulation over curve \( C \), where \( C \) is the circle of radius \( R \).

\[
\mathbf{v} = \begin{cases} 
2 \hat{i}, & R \leq y \leq R \\
0, & \text{else} 
\end{cases}
\]

\[
\mathbf{r} = \begin{bmatrix} c \\ s \end{bmatrix}, \quad \mathbf{r}' = \begin{bmatrix} -s \\ c \end{bmatrix}, \quad \mathbf{v} = \begin{bmatrix} 2 \\ 0 \end{bmatrix}
\]

\[
\Gamma = \oint_C \mathbf{v} \cdot d\mathbf{r}
\]

\[
= \int_0^{2\pi} \begin{bmatrix} 2 \\ 0 \end{bmatrix} \cdot \begin{bmatrix} -s \\ c \end{bmatrix} \, dt
\]

\[
= \int_0^{2\pi} -2s \, dt = 0
\]

\[
= \int_0^{\pi} -2s \, dt + \int_{\pi}^{2\pi} -2s \, dt
\]

\[
= -4 + 4 = 0
\]

For part a), the circulation is \( 0 \) because the circulation over \( [0, \pi] \) cancels with the circulation over \( [\pi, 2\pi] \).

For part b), the circulation is \( \ldots \) because \( \ldots \).
Application of Circulation

The circulation of a vector field $\mathbf{V}$ around a directed closed curve is

$$\text{circulation} = \Gamma = \oint_C \mathbf{v}(\mathbf{r}) \cdot d\mathbf{r}$$

- Note the cross-sectional profile of the wing
- Take $C$ to be a path around the wing, on its surface
- Upward lift force is proportional to circulation, $\Gamma$
16.2: An Application of Circulation

Take $C$ to be a closed path around the wing on its surface.

- Write $\Gamma$ as $\Gamma = \Gamma_{\text{upper}} + \Gamma_{\text{lower}}$
- $\Gamma_{\text{upper}}$ and $\Gamma_{\text{lower}}$ have opposite signs
- the magnitude of $V$ along the upper surface of the wing is greater than along the lower surface: net circulation is non-zero
16.2: Flux Across a Closed Plane Curve

Suppose we have a curve \( C \) in the xy plane, and a flow field \( \mathbf{v} = M(x,y)\mathbf{i} + N(x,y)\mathbf{k} \). We want to measure the net flow through \( C \).

- \( k \) is the unit vector parallel to the z-axis
- \( T \) is the tangent vector
- \( N \) is the outward pointing unit normal vector of \( C \)

\[
\text{flux} = \oint_C \mathbf{v} \cdot \mathbf{N} \, dt = \oint_C M \, dy - N \, dx
\]

counterclockwise motion

Note that:
- for a clockwise motion, we would instead use \( k \times T \)
- later on, we will make a connection between flux and Green’s theorem
Calculate the flux over curve C, where C is the circle of radius R.

\[ \vec{v} = \begin{cases} 
2\hat{i}, & R \leq y \leq R \\
0, & \text{else} 
\end{cases} \]

\[ \text{Flux} = \oint_C M \, dy - N \, dx \]

\[ M = 2, \quad N = 0 \]
\[ x = R \cos t, \quad dx = -R \sin t \, dt \quad t \in [0, 2\pi] \]
\[ y = R \sin t, \quad dy = R \cos t \, dt \]

\[ \text{Flux} = \int_0^{2\pi} (2)(R \cos t) - (0)(-R \sin t) \, dt \\
= \int_0^{2\pi} 2R \sin t \, dt = 0 \]

Therefore: the flux is \( \bigcirc \) because in flow = out flow.
16.2: Circulation and Flux

1) Sketch the velocity field for \( \mathbf{v} = -\mathbf{i} - \mathbf{j} \), and calculate the circulation and flux over curve \( C \), where \( C \) is the circle of radius \( R \).

\[
\mathbf{F} = \begin{bmatrix} R_c \\ R_s \end{bmatrix}, \quad \mathbf{F}' = \begin{bmatrix} -R_s \\ R_c \end{bmatrix}, \quad \mathbf{n} = \begin{bmatrix} -x \\ -y \end{bmatrix} = \begin{bmatrix} -Rc \\ -Rs \end{bmatrix}
\]

\[
\Gamma = \oint_C \mathbf{F} \cdot d\mathbf{r} = \oint_C \mathbf{F}'(t) \cdot d\mathbf{r} = \oint_0^{2\pi} \mathbf{n} \cdot (\mathbf{F}'(t) \times \mathbf{n}) dt
\]

\[
= \oint_0^{2\pi} \begin{bmatrix} -Rc \\ -Rs \end{bmatrix} \cdot \begin{bmatrix} -Rs \\ R_c \end{bmatrix} dt = \oint_0^{2\pi} 0 dt = 0
\]

Therefore: the circulation is \( 0 \) because \( \text{flow always perpendicular to } C \).

Therefore: the flux is \( -2\pi R^2 \) because \( \text{all flow is inward} \).
2) Sketch the velocity field for \( \mathbf{v} = - y\mathbf{i} + x\mathbf{j} \), and calculate the circulation and flux over curve \( C \), where \( C \) is the circle of radius \( R \).

\[
\mathbf{v}(1,0) = [1], \quad \mathbf{v}(0,1) = [-i]
\]

We solved this problem in the next recitation, R29.
16.3: Conservative Vector Fields

Recall the Pipe example.

a) Why was the circulation zero?

\[ \Gamma \text{ on } [0, \pi] \text{ cancelled with } \Gamma \text{ over } [\pi, 2\pi] \]

b) For any path that starts and ends at point A, and stays inside "the pipe", the circulation is \textit{the same}.

c) For all paths that starts at A and ends at point B, the integral \[ \oint_C \mathbf{v} \cdot d\mathbf{r} \] is the same.

In general: if \( \mathbf{v} \) is a conservative vector field (or is path independent), then there exists a scalar field, \( S \), s.t. \( \nabla S = \mathbf{v} \).
Recitation 29

Today's Topics

- 16.2 Vector Fields and Line Integrals, Work, Circulation, Flux
- 16.3 Path Independence
- 16.4 Green's Theorem

Learning Objectives

16.2 Set-up, evaluate, and interpret integrals to calculate circulation and flux
16.3 Determine whether a vector field is conservative and apply the FTCI
16.4 Apply Green's theorem to calculate area and flux

Circulation and Flux

Circulation is a measure of flow along a path.

Flux is a measure of flow through a region.

\[
\text{circulation} = \Gamma = \oint_C \vec{v}(\vec{r}) \cdot d\vec{r} = \int_a^b \vec{v}(\vec{r}(t)) \cdot \vec{r}'(t) dt
\]

\[
\text{flux} = \iint_C \vec{v} \cdot \hat{N} \, dt = \iint_C M \, dy - N \, dx
\]
16.2: Circulation and Flux (review)

1) Sketch the velocity field for $\mathbf{v} = -x\mathbf{i} - y\mathbf{j}$, and calculate the circulation and flux over curve C, where C is the circle of radius R.

\[ \Gamma = \oint_C \mathbf{v} \cdot d\mathbf{r} = \oint_C [-Rs] \cdot [-Rs] \, dt \]
\[ = \oint_C 0 \, dt = 0 \]

\[ \text{flux} = \oint_C M \, dy - N \, dx, \quad dy = \frac{du}{dt} \, dt = +Rc \, dt \]
\[ = \oint_C (-Rc)(Rc \, dt) - (Rs)(-Rs \, dt) \]
\[ = \oint_C -R^2 (c^2 + s^2) \, dt \]
\[ = -2\pi R^2 \]

Therefore: the circulation is 0 because flow perpendicular to path.

Therefore: the flux is $-2\pi R^2$ because inward flow.
16.3: Conservative Vector Fields

In general: if \( \mathbf{F} \) is a conservative vector field (or is path independent), then there exists a scalar field, \( f \), s.t. \( \nabla f = \mathbf{F} \), and

\[
\int_{c} \mathbf{F} \cdot d\mathbf{r} = \int \nabla f \cdot d\mathbf{r} = f(b) - f(a)
\]

**Example:** Calculate total work from the force \( \mathbf{F} = (x^2 - y)i + (y^2 - x)j \), over the path \( \mathbf{r} = a \cos(t)i + b \sin(t)j \), where \( 0 \leq t \leq 2\pi \).

Is \( \mathbf{F} \) conservative? Two ways to check.

1. Check if derivatives match: \( \frac{\partial}{\partial y}(x^2 - y) = -1 \) \( \neq \frac{\partial}{\partial x}(y^2 - x) = -1 \)

2. Find potential:

\[
\frac{\partial f}{\partial x} = x^2 - y \implies f = \frac{x^3}{3} - yx + \phi(y) \implies \frac{\partial f}{\partial y} = -x + \phi' \]

and \( \phi' = y^2 \) by comparison. Thus \( f \) exists, and is

\[
f = \frac{1}{3} (x^3 + y^3) - xy
\]

\( \mathbf{F} \) is conservative, so use FTCII:

\[
\int_{c} \mathbf{F} \cdot d\mathbf{r} = f(2\pi) - f(0) = 0
\]
Determine whether the following fields are conservative

1) \( \mathbf{v} = -x \mathbf{i} - y \mathbf{j} \)

\[
\frac{\partial}{\partial y} (-y) = 0 = \frac{\partial}{\partial x} (-y) \quad \Rightarrow \quad \text{conservative}
\]

2) \( \mathbf{v} = -y \mathbf{i} + x \mathbf{j} \)

\[
\frac{\partial}{\partial y} (-y) = -1 \neq \frac{\partial}{\partial x} (x) = 1 \quad \Rightarrow \quad \text{not conservative}
\]
2) Sketch the velocity field for \( \mathbf{v} = -y\mathbf{i} + x\mathbf{j} \), and calculate the circulation and flux over curve \( C \), where \( C \) is the circle of radius \( R \).

\[
\Gamma = \oint_C \mathbf{v} \cdot d\mathbf{r}, \quad \Gamma = \left[ \begin{array}{c} R_c \\ R_s \end{array} \right], \quad \nabla' = \left[ \begin{array}{c} -R_s \\ +R_c \end{array} \right]
\]

\[
= \int_0^{2\pi} \left[ -R_s \right] \cdot \left[ +R_c \right] dt
\]

\[
= R^2 \int_0^{2\pi} s^2 + c^2 dt = 2\pi R^2
\]

\[
\Phi_{\text{flux}} = \int_0^{2\pi} (-R_s)(R_c dt) - (R_c)(-R_s dt)
\]

\[
= \int_0^{2\pi} 0 dt = 0
\]

**Flux is zero because there is no flow in/out of region. Circulation \( \Gamma \), is positive because flow is in direction of motion along \( C \).**
Conclusions

a) Circulation measures flow along path C.

b) Flux measures the flow through of region C.

c) If a flow is conservative, the line integral $\oint_C \mathbf{F} \cdot d\mathbf{r}$ is the same for any path C.

Recitation 30

Today's Topics
16.4 Green's Theorem
16.5 Surfaces and Areas

Learning Objectives
16.4 Apply Green’s theorem to calculate area, flux, and circulation
16.5 Calculate the area of a surface given explicitly, implicitly, or parametrically

Green’s Theorem
If \(R\) is a region that is \(\text{closed, simple}\), and \(M\) and \(N\) are scalar fields that are differentiable on \(R\), and \(C\) is the boundary of \(R\), then:

\[
\text{flux} = \oint_C M \, dy - N \, dx = \iint_R \left( \frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} \right) \, dx \, dy \quad \text{divergence} \quad *
\]

\[
\text{circulation} = \oint_C M \, dx + N \, dy = \iint_R \left( \frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} \right) \, dx \, dy \quad (= \oint_C \vec{F} \cdot \vec{dr}) \quad \text{curl} \, \vec{F} \cdot \hat{k} \quad *
\]

* we don't need div & curl at this point, but we will soon
Green’s Theorem Example (from an old quiz)

Below are five regions. For which regions can we apply Green’s Theorem?

a) simple & closed
   ⇒ can apply GT

b) not simple,
   ⇒ can apply GT if we
   eg-use two integrals

c) simple = no holes, and boundary is not “self-intersecting,”
Find the circulation AND flux for the field \( F = 3x^2y^2 \mathbf{i} + 2x^3y \mathbf{j} \) around the rectangle \( 0 \leq x \leq 2, \ 0 \leq y \leq 3 \). Use Green's Theorem.

\[
\text{Flux} = \oint_C M \, dy - N \, dx = \iint_D \left( \frac{\partial N}{\partial x} \right) dx \, dy - \left( \frac{\partial M}{\partial y} \right) dy \, dx
\]

\[
= \iint_D \frac{\partial}{\partial x} (2x^3y) - \frac{\partial}{\partial y} (3x^2y^2) \, dx \, dy
\]

\[
= \int_0^2 \int_0^3 6x^2y - 6x^2y \, dx \, dy
\]

\[
= 0
\]

In the above, \( M = 3x^2y^2, \ N = 2x^3y \)
Green's Theorem Example (from an old quiz)

Let $R$ be the region in the plane, inside the cardioid $r = 1 + \cos(\theta)$, and $C$ its boundary. Consider the line integral

$$\int_C xy \, dx - xy^2 \, dy.$$ Use Green's theorem to convert to an double integral, and express this as a double integral in polar coordinates with limits.

$$\text{flux} = \oint M \, dy - N \, dx$$

$$M = -xy^2, \quad \frac{\partial M}{\partial x} = -y^2$$

$$N = -xy, \quad \frac{\partial N}{\partial y} = -x$$

Alternate: $\Gamma = \oint M \, dx + N \, dy$

$$M = xy, \quad \frac{\partial M}{\partial x} = +x$$

$$N = -xy^2, \quad \frac{\partial N}{\partial y} = -y^2$$

$$\Gamma = \iint N_x - M_y \, dx \, dy = \iint -y^2 - x \, dx \, dy$$

$$= \int_0^{2\pi} \int_0^1 \left(1 + \cos\theta\right) \left(-r^2 \sin^2\theta - r\cos\theta\right) \, r \, dr \, d\theta$$
The curve traced by a point on a rolling wheel is

\[ x(t) = t - \sin(t) \]
\[ y(t) = 1 - \cos(t) \]
Additional Example: Green’s Theorem

Find the area under one arch of the cycloid:
\[ x(t) = t - \sin(t), \quad y(t) = 1 - \cos(t) \]

Find the area under one arch of the cycloid:
\[ x(t) = t - \sin(t), \quad y(t) = 1 - \cos(t) \]

\[ A = \iint_D \, dx \, dy \]

We don't have \( y = y(x) \) explicitly. What can we do?

Introduce
\[ M = x, \quad \frac{2m}{2x} = m \]
\[ N = 1, \quad \frac{2n}{2y} = 0 \]

\[ A = \iint_D \left( \frac{2m}{2x} + \frac{2n}{2y} \right) \, dx \, dy = \iint_D \, dx \, dy, \text{ as needed.} \]

On \( C_1: \)
\[ x = t, \quad y = 0, \quad dy = 0 \, dt \]

On \( C_2: \)
\[ x = t - \sin t, \quad y = 1 - \cos t, \quad dy = -\sin t \, dt \]

\[ \int_C x \, dy = 0 \, dx \]

\[ = \int_{C_1} x \, dy + \int_{C_2} x \, dy \]

\[ = \int_0^{2\pi} t \cdot 0 \, dt + \int_{\pi}^{2\pi} (t - \sin t) \, dt \]

\[ = \pi = 3\pi \]
**Additional Example: Green’s Theorem**

a) Evaluate $\int_C y^2 \, dx + 2xy \, dy$, $C$ is one loop of $r = 2\sin 2\theta$

b) Change the integral so that it represents the area of one loop.

**A)** We need a formulation of Green’s Theorem. We can use

$$\text{flux} = \oint_C M \, dy - N \, dx = \iint_D \frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} \, dx \, dy$$

(some textbooks use a slightly different formula)

\[ \Rightarrow \begin{align*}
M &= 2xy, & \frac{\partial M}{\partial x} &= 2y \\
N &= -y^2, & \frac{\partial N}{\partial y} &= -2y
\end{align*} \]

Integrand is zero, so answer is zero.

**B)** For area, we need $\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} = 1$.

We can choose:

\[ \begin{align*}
M &= 3xy, & M_x &= 3y \\
N &= -y^2, & N_y &= -2y
\end{align*} \]

Area = $\iint_D M_x + N_y \, dx \, dy = \int_0^{2\pi} \int_0^2 (3\sin 2\theta) r \, dr \, d\theta$
16.5 Surfaces and Areas

Surface area for a parameterized surface:

\[ S = \iiint d\sigma, \quad d\sigma = \sqrt{|r_u \times r_v|^2} \, du \, dv \]

Your textbook has formulas for calculating the surface area for **implicit** and **explicit** surfaces, we probably won’t have time to work on these in recitation.
16.5 Surfaces and Areas

a) What properties does a parametric representation of a surface need to have?

1. satisfy given surface
2. one-to-one
3. continuous

b) Find a parametric representation for the part of the plane \( z = x + 2 \) in the first octant and inside the cylinder \( x^2 + y^2 = 1 \).

Parametric representation is:

\[
\vec{r} = x(u,v) \hat{i} + y(u,v) \hat{j} + z(u,v) \hat{k}
\]

where

\[
x = u \cos v \\
y = u \sin v \\
z = u \cos v + 2
\]

which is \( 0, 0, 0 \), for \( u \in [0, 1], v \in [0, \frac{\pi}{2}] \).
Recitation 31

Today’s Topics
16.5 Surfaces and Areas
16.6 Surface Integrals

Learning Objectives
16.5 Calculate the area of a surface given explicitly, implicitly, or parametrically
16.6 Calculate outward flux through a surface
16.6 Calculate the total mass and centroid of a thin surface (if time permits)

Course Logistics
1. Has a final exemption cutoff been announced?
2. What is the cutoff?
3. When is your final exam?
16.5 Surfaces and Areas

Surface area for a parameterized surface:

\[ \text{Surface area} = \iint_S d\sigma, \quad \sigma = |\vec{r}_u \times \vec{r}_v| \, du \, dv \]

Your textbook has formulas for calculating the surface area for **implicit** and **explicit** surfaces, we probably won’t have time to work on these in recitation.

\[ \vec{r} \text{ is a parameterization of our surface, and} \]

\[ \vec{r} = \vec{F}(u, v) \]

\[ \vec{r}_u = \frac{\partial}{\partial u} \vec{r} \]

\[ \vec{r}_v = \frac{\partial}{\partial v} \vec{r} \]
16.5 Surface Area Example

Set-up an integral that represents the surface area of \( z = y^2 \), for \( 0 \leq x \leq a \), \( 0 \leq y \leq b \).

Surface Area: \( S \mathcal{S} | \vec{F}_u \times \vec{F}_v | \, du \, dv \)

We need parameterization, \( \vec{r}(u,v) \):

\[
\begin{align*}
\chi &= u, \quad u \in [0, a] \\
y &= v, \quad v \in [0, b] \\
z &= v^2
\end{align*}
\]

\[ \vec{r} = \begin{bmatrix} u \\ v \\ v^2 \end{bmatrix} \]

We need \( \left| \vec{F}_u \times \vec{F}_v \right| \)

\[ \vec{F}_u = \begin{bmatrix} 1 \\ u \\ 0 \end{bmatrix}, \quad \vec{F}_v = \begin{bmatrix} 0 \\ 1 \\ 2v \end{bmatrix}, \quad \vec{F}_u \times \vec{F}_v = \begin{bmatrix} u & 0 & -2v \\ 0 & 1 & 2v \\ -u & -2v & 1 \end{bmatrix} \]

\[ \left| \vec{F}_u \times \vec{F}_v \right| = \sqrt{4v^2 + 1} \]

Calculate Surface Area

\[ S \mathcal{S} | \vec{F}_u \times \vec{F}_v | \, du \, dv = \int_0^b \int_0^a \sqrt{1 + 4v^2} \, du \, dv \] (If interested, can get area w/ table of integrals)
16.5 Surface Area Example

Set up an integral that represents the area of the part of the plane $x + 2y + z = 4$ that is inside the cylinder $x^2 + y^2 = 4$.

$$\text{Surface area} = \iint_S d\sigma = \iint_S |\overrightarrow{r}_u \times \overrightarrow{r}_v| \, dudv$$

$$\overrightarrow{r} = \left[ \begin{array}{c} u \\ v \\ u^2 - 2v \end{array} \right], \quad \overrightarrow{r}_u \times \overrightarrow{r}_v = \begin{vmatrix} 1 & 0 & -1 \\ 0 & 1 & -2 \\ 1 & -1 & 0 \end{vmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

$$\iint_S d\sigma = \iint_S \sqrt{6} \, dudv, \quad u^2 + v^2 \leq 4$$

$$= \int_0^{2\pi} \int_0^2 \sqrt{6} \, r \, dr \, d\theta$$

$$= 4\sqrt{6} \pi$$
16.6 Surface Integrals

Suppose we want to characterize 3D flow through a pipe.

To calculate 2D flux across a curve, we used: \( \text{flux} = \int_C \vec{v} \cdot \vec{n} \, du = \int_C M \, dy - N \, dx \)

If our flow field, \( \vec{v} \), is 3D, we calculate flux across a surface.

\[
\iint_S \vec{v} \cdot \vec{n} \, ds = \iiint_S \vec{v} \cdot \left( \frac{\vec{r}_u \times \vec{r}_v}{|\vec{r}_u \times \vec{r}_v|} \right) \, du \, dv,
\]

because \( \vec{n} = \frac{\vec{r}_u \times \vec{r}_v}{|\vec{r}_u \times \vec{r}_v|} \).
16.6 Flux Through a Surface

A fluid has velocity field \( \mathbf{v} = yi + j + zk \). Set up an integral that represents the flux through the paraboloid \( z = 9 - (x^2 + y^2)/4 \), if \( x^2 + y^2 \leq 36 \).

\[
\text{flux} = \iint \nabla \cdot \mathbf{n} \, dS = \iint (\nabla \cdot (\mathbf{r}_u \times \mathbf{r}_v)) \, dudv
\]

\[
\mathbf{r} = \begin{bmatrix} u \\ v \\ \frac{9-\left(u^2 + v^2\right)/4}{2} \end{bmatrix}, \quad \mathbf{r}_u = \begin{bmatrix} 1 \\ 0 \\ -u/2 \end{bmatrix}, \quad \mathbf{r}_v = \begin{bmatrix} 0 \\ 1 \\ -v/2 \end{bmatrix}, \quad \mathbf{r}_u \times \mathbf{r}_v = \begin{vmatrix} i & j & k \\ 1 & 0 & -u/2 \\ 0 & 1 & -v/2 \end{vmatrix} = \begin{bmatrix} u/2 \\ v/2 \\ 1 \end{bmatrix}
\]

\[
x^2 + y^2 \leq 36 \quad \text{implies} \quad u^2 + v^2 \leq 36
\]

\[
\text{flux} = \iint \nabla \cdot (\mathbf{r}_u \times \mathbf{r}_v) \, dudv = \iint \left[ \mathbf{r}_v \cdot \begin{bmatrix} u/2 \\ v/2 \\ 1 \end{bmatrix} \right] \, dudv
\]

\[
= \iint \left[ uv/2 + v/2 + 9 - u^2/4 - v^2/4 \right] \, dudv
\]

For limits, use \( u = r \cos \theta = r \cos \theta \), \( v = r \sin \theta = r \sin \theta \):

\[
\text{flux} = \int_0^{2\pi} \int_0^6 \frac{1}{2} \left( r^2 \cos \theta + rs \right) + 9 - \left( r^2 \cos^2 \theta + r^2 \sin^2 \theta \right)/4 \ r dr d\theta
\]
16.6 Surface Integrals (this was a 2014 pop quiz question)

Set up a double integral that represents the flux of flow \( \mathbf{F} = x\mathbf{i} + z\mathbf{k} \) thorough the surface \( z(x,y) = x^2 - y^2 \), where \( 0 \leq x \leq 1 \), \(-1 \leq y \leq 1\).

\[
\vec{r} = \begin{bmatrix} u \\ v \\ r^2 \end{bmatrix}, \quad \vec{r}_u = \begin{bmatrix} 1 \\ 0 \\ 2u \end{bmatrix}, \quad \vec{r}_v = \begin{bmatrix} 0 \\ 1 \\ -2v \end{bmatrix}, \quad \vec{r}_u \times \vec{r}_v = \begin{bmatrix} -2v \\ 2u \\ 0 \end{bmatrix}
\]

\[
\mathbf{F} \cdot \vec{r}_u \times \vec{r}_v 
\]

\[
= \iiint (u^2 - v^2) \, dv \, du
\]

\[
= \int_{-1}^{1} \int_{0}^{1} (u^2 - v^2) \, dv \, du
\]

\[
= \frac{1}{3} \int_{0}^{1} u^3 \, du - \frac{1}{2} \int_{-1}^{1} v^2 \, dv
\]

\[
= \frac{1}{3} \left[ u^3 \right]_{0}^{1} - \frac{1}{2} \left[ \frac{v^3}{3} \right]_{-1}^{1}
\]

\[
= \frac{1}{3} - \frac{2}{3} = -\frac{1}{3}
\]
16.6 Centroid of a Thin Surface (if time permits)

The mass density at any point on a thin surface \( z^2 = x^2 + y^2, 0 \leq z \leq 1 \), is proportional to its distance to the \( z \)-axis.

a) Find the total mass of the surface.
b) Find the centroid of the surface.

\[ M = \iint_S \rho(x, y, z) \, d\sigma = \iint_S k \left( x^2 + y^2 \right) \, d\sigma, \quad k = \text{constant}, \quad d\sigma = \left| \vec{r}_u \times \vec{r}_v \right| \, du \, dv \]

\[ \vec{r} = \begin{bmatrix} u \\ v \\ \sqrt{u^2 + v^2} \end{bmatrix}, \quad \vec{r}_u \times \vec{r}_v = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, \quad \left| \vec{r}_u \times \vec{r}_v \right| = \sqrt{2} \]

\[ \Rightarrow M = \iint_S k \left( u^2 + v^2 \right) \left( \sqrt{2} \, du \, dv \right) = \sqrt{2} k \int_0^{2\pi} \int_0^1 r^2 \, dr \, d\theta = \frac{2}{3} \sqrt{2} \pi k \]

b) We want \((\bar{x}, \bar{y}, \bar{z})\), but \( \bar{x} = \bar{y} = 0 \) by symmetry.

\[ \bar{z} M = \iint_S z \rho(x, y, z) \, d\sigma = \iint_S k \left( x^2 + y^2 \right)^2 \left( \sqrt{2} \, du \, dv \right) \]

\[ = \sqrt{2} k \int_0^{2\pi} \int_0^1 r^3 \, dr \, d\theta \]

\[ = \frac{\sqrt{2}}{2} \pi k \]
16.5 Surface Area Parameterization (additional example)

Find parametric representations for the following surfaces.

a) the upper half of $4x^2 + 9y^2 + z^2 = 36$

b) the part of the plane $z = x + 2$ inside the cylinder of $x^2 + y^2 = 1$

\[ a) \text{ divide by 36: } \frac{x^2}{36} + \frac{y^2}{4} + \frac{z^2}{36} = 1, \text{ use modified spherical} \]
\[ x = 3 \cos u \cos v \]
\[ y = 2 \sin u \cos v \]
\[ z = 6 \sin v \]
\[ u \in [0, 2\pi], \quad v \in [0, \frac{\pi}{2}] \]

\[ b) \begin{align*}
  x &= r \cos \theta \\
  y &= r \sin \theta \\
  z &= r \cos \theta + 2
\end{align*} \]
\[ r \in [0, 1], \quad \theta \in [0, 2\pi] \]
Recitation 32

Today's Topics
Final Exam Review
16.7 Stokes Theorem
16.8 The Divergence Theorem

Learning Objectives
16.7 Use Stoke's theorem to calculate either work, or circulation over a curve
16.8 Calculate flux through a surface using the divergence theorem

Final Exam Logistics
Review session: information sent via email
Questions during final: information sent via email
Studying for the Final Exam

There are two prep-finals available on T². Each of them have five questions that focus on specific areas of our textbook.

<table>
<thead>
<tr>
<th></th>
<th>Chapter 13</th>
<th>Chapter 14</th>
<th>Chapter 15</th>
<th>Chapter 16</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Ways you may want to study:
- solve prep final questions
- re-do quizzes 1 through 4
- re-do MML problems
- memorize formulas (especially from Chapters 13 and 16)
PrepFinal Question A1

Find the speed, the tangential acceleration and the normal acceleration for the motion \( \mathbf{r} = (t, t^2, t^3) \). Compute also the curvature of the corresponding curve as a function of \( t \).

\[
\text{speed} = |\mathbf{v}| = \frac{d}{dt} \left[ \begin{array}{l} t \\ t^2 \\ t^3 \end{array} \right] = \left| \frac{d}{dt} \left[ \begin{array}{l} t \\ t^2 \\ t^3 \end{array} \right] \right| = \sqrt{1 + 4t^2 + 4t^4} = \sqrt{1 + 8t^2}
\]

\[
a_T = \left. \frac{d}{dt} \right| |\mathbf{v}| = \frac{d}{dt} \sqrt{1 + 8t^2} = \frac{1}{2} (1 + 8t^2)^{-\frac{1}{2}} \left( \frac{d}{dt} (1 + 8t^2) \right) = 8t \sqrt{1 + 8t^2}
\]

\[
a_N = \sqrt{|\mathbf{v}''|^2 - |a_T|^2} = \sqrt{\left( \left[ \begin{array}{l} 2t^2 \\ 2t \\ 6t^2 \end{array} \right] \right)^2 - \frac{8^2 t^4}{(\sqrt{1 + 8t^2})^2}} = \sqrt{\left( \sqrt{\frac{128t^2}{1 + 8t^2}} \right)^2 - \frac{128t^2}{1 + 8t^2}} = \sqrt{8 - \frac{128t^2}{1 + 8t^2}}
\]

(we could have also used \( a_N = \frac{|\mathbf{v}'| \times \mathbf{v}''}{|\mathbf{v}'|^3} \))

\[
\kappa = \frac{|\mathbf{v}' \times \mathbf{v}''|}{|\mathbf{v}'|^3} = \frac{1}{(1 + 8t^2)^{\frac{3}{2}}} \left| \begin{array}{l} t \\ t^2 \\ t^3 \end{array} \right| \left| \begin{array}{l} 0 \\ 2t \\ 2t \end{array} \right| = \left( 1 + 8t^2 \right)^{-\frac{3}{2}} \left| \begin{array}{l} 0 \\ t \\ -t \end{array} \right| = 8 \left( 1 + 8t^2 \right)^{-\frac{3}{2}}
\]
PrepFinal Question A2

Find the moment of inertia with respect to the x axis of a thin shell of mass δ that is in the first quadrant of the xy plane and bounded by the curve $r^2 = \sin 2\theta$.

1) PLOT CURVE

2) SET UP INTEGRAL, INTEGRATE

\[ I_x = \frac{1}{3} \int_0^\frac{\pi}{4} \int_0^{\sqrt{\sin 2\theta}} y^3 \, dy \, dx \]

\[ = \frac{5}{3} \int_0^\frac{\pi}{4} \int_0^{\sqrt{\sin 2\theta}} (r^2 \sin^2 \theta) \, r \, dr \, d\theta \]

\[ = \frac{5}{3} \int_0^\frac{\pi}{4} \frac{\pi}{2} \sin^3 \theta \, d\theta \]

\[ = \frac{5}{4} \int (\sin^3 \theta)(\sin 2\theta) \, d\theta \]

\[ = \frac{5}{4} \int (\sin^4 \theta \cos^2 \theta) \, d\theta \]

\[ = \frac{5}{4} \int (\sin^4 \theta - \sin^6 \theta) \, d\theta \]

\[ = \frac{5}{4} \int \left( \frac{3\pi}{2} - \frac{5\pi}{2} \right) \, d\theta \]

\[ = \frac{5}{2} \]
Prep Final Question A3

Compute the center of mass of a thin shell that is formed by the cone $(z-2)^2 = x^2 + y^2$, $0 \leq z \leq 2$.

We went $(x, y, z)$, but $\bar{x} = \bar{y} = 0$ by symmetry.

$M = M_{x,y}$, $M = \iiint_S s \, d\sigma$, $M_{x,y} = \iiint_S z \, s \, d\sigma$.

Assume $d = \text{constant}$.

$M = \iiint_S |r_u \times r_v| \, dudv$

$F = \begin{bmatrix} u \\ v \\ 2 + \sqrt{u^2 + v^2} \end{bmatrix}$, $r_u \times r_v = \begin{vmatrix} i & j & k \\ 0 & 0 & 1 \\ 1 & 0 & \sqrt{u^2 + v^2} \end{vmatrix}$, $|r_u \times r_v| = \sqrt{u^2 + v^2 + 1}$, $\sqrt{\frac{u^2}{u^2 + v^2} + \frac{v^2}{u^2 + v^2} + 1} = \sqrt{2}$

$M = \iiint_S \sqrt{2} \, s \, dudv = \sqrt{2} \int_0^2 \int_0^{2\pi} r \, dr \, d\theta = \sqrt{2} \pi \int_0^{2\pi} \frac{r^2}{2} \, d\theta = \sqrt{2} \pi \int_0^{2\pi} \frac{r^2}{2} \, d\theta = \frac{\pi}{2} \int_0^{2\pi} \frac{r^3}{3} \, d\theta = \frac{2\pi}{3} \int_0^{2\pi} r^3 \, d\theta = \frac{2\pi}{3} \int_0^{2\pi} r^3 \, d\theta$ on the cone, $z = 2 - r$, and $r \in [0, 2]$, $M_{x,y} = \iiint_S \sqrt{2} z \, dudv = \sqrt{2} \int_0^2 \int_0^{2\pi} (2 - r) \, r \, dr \, d\theta = \sqrt{2} \pi \int_0^2 \frac{r^2}{2} \, d\theta = \frac{\pi}{2} \int_0^2 \frac{r^3}{3} \, d\theta = \frac{2\pi}{3} \int_0^2 r^3 \, d\theta = \frac{2\pi}{3} \int_0^2 r^3 \, d\theta$

$\bar{z} = \frac{M_{x,y}}{M} = \frac{2\pi (4/3) \sqrt{2} \pi}{\sqrt{2} \pi 8/3} = \frac{2}{3} \Rightarrow (\bar{x}, \bar{y}, \bar{z}) = (0, 0, \frac{2}{3})$
Final Question A

Compute the line integral of the vector field \( \mathbf{F} = (xyz + 1, x^2z, x^2y) e^{xyz} \) along the curve \( \mathbf{r}(t) = (\cos t, \sin t, t), \quad 0 \leq t \leq \pi \).

We want \( \int_C \mathbf{F} \cdot d\mathbf{r} \). We can't use Green's Thm, or Stokes thm, because \( C \) is not closed.

\[
\int_C \mathbf{F} \cdot d\mathbf{r} = \int_0^\pi e^{\cos t} \begin{bmatrix} \cos t \\ t^2 \\ t^2 \end{bmatrix} \cdot \begin{bmatrix} t \\ t \\ 0 \end{bmatrix} dt,
\]

\[
= \int_0^\pi e^{\cos t} \left( -t \cos t - s + t^2 + c^2 s \right) dt.
\]

Direct integration is very difficult. However, if \( \mathbf{F} \) is a conservative field, we can use the FTCI.

If \( \nabla \times \mathbf{F} = 0 \), then \( \mathbf{F} \) is conservative; \( \nabla \times \mathbf{F} = \begin{vmatrix} \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2 & x^2 & x^2 \end{vmatrix} = 0 \). Thus \( \mathbf{F} \) is conservative, and we can apply the FTCI. To do so, we need to find a \( \phi(x,y,z) \) st. \( \nabla \phi = \mathbf{F} \). By inspection, \( \phi = xe^{xyz} \). Thus,

\[
\int_C \mathbf{F} \cdot d\mathbf{r} = \phi(\cos \pi, \sin \pi, \pi) - \phi(\cos 0, \sin 0, 0) = (-1) - (+1) = -2.
\]
PrepFinal Question A5

Use the divergence theorem to compute the outward flux of the vector field \( \mathbf{F} = (x^2, y^2, z^2) \) through the cylindrical can that is bounded on the side by \( x^2 + y^2 = 4 \), bounded above by \( z = 1 \) and below by \( z = 0 \).

\[
\text{outward flux} = \iiint_{V} \nabla \cdot \mathbf{F} \, dV = \iint_{S} \mathbf{F} \cdot \mathbf{n} \, d\sigma
\]

\[
= \iiint_{V} \left( 2x + 2y + 2z \right) \, dV
\]

\[
= 2 \int_{0}^{2\pi} \int_{0}^{2} \int_{0}^{1} \left( r \cos \theta + r \sin \theta + \frac{r^2}{2} \right) \, r \, dr \, dz \, d\theta
\]

\[
= 2 \int_{0}^{2\pi} \left( \frac{r^3}{3} \left( \cos \theta + \sin \theta \right) + \frac{r^2}{4} \right) \bigg|_{0}^{1} \, d\theta
\]

\[
= 2 \int_{0}^{2\pi} \left( \frac{8}{3} \cos \theta + \frac{8}{3} \sin \theta + 1 \right) \, d\theta
\]

\[
= 2 \left( \frac{8}{3} (0 - 1) - \frac{8}{3} (0 - 1) + 1 \right) = 0
\]
PrepFinal Question B1

Find the parametric equations of the line that is tangent to the curve $\mathbf{r}(t) = (e^t, \sin t, \ln(1 - t))$, at $t = 0$.

$\mathbf{r}' = \begin{bmatrix} e^t \\ c \\ \frac{-1}{1-t} \end{bmatrix}$, \quad c = \cos t, \quad \mathbf{r}(0) = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$

$\mathbf{r}'(0) = \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}$

Line has equation $\mathbf{L} = \mathbf{r}(0) + \lambda \mathbf{r}'(0)$, \quad $\lambda \in \mathbb{R}$

$= \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} + \lambda \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}$
PrepFinal Question B2

Find the minimum cost area of a rectangular solid with volume 64 cubic inches, given that the top and sides cost 4 cents per square inch and the bottom costs 7 cents per square inch. Just set up the equations using Lagrange multipliers, you do not have to solve them.

\[ V = 64 = LW \cdot H \]

\[ C = 4LW + 4\cdot 2LH + 4 \cdot 2WH + 7LW \]

\[ = 11LW + 8LH + 8WH \]

\[ \nabla C = 2 \nabla V \]

\[ \begin{bmatrix} 11W + 8H \\ 11L + 8H \\ 8L + 8W \end{bmatrix} = \lambda \begin{bmatrix} WH \\ LH \\ LW \end{bmatrix} \]

and \( LW \cdot H = 64 \)
PrepFinal Question B3

Compute the average of the function $x^4$ over the sphere centered at the origin whose radius is $R > 0$. 

(I'm assuming that we want average over solid sphere, not its surface)

In general, \[ \iiint_V f(x,y,z) \, dx \, dy \, dz = \left( \text{average of } f \right) \cdot \left( \text{volume of } V \right) \]

So for this problem,

\[ \left( \frac{4}{3} \pi R^3 \right) \left( \text{average} \right) = \iiint_V x^4 \, dx \, dy \, dz \]

\[ = \int_0^{2\pi} \int_0^R \int_0^\pi x^4 r^2 \sin \phi \, d\phi \, dr \, d\theta, \quad x^4 = r^4 \sin^4 \phi \cos^4 \theta \]

\[ = \int_0^{2\pi} \int_0^R \int_0^\pi r^6 \sin^5 \phi \cos^4 \theta \, d\phi \, dr \, d\theta \]

\[ = \frac{R^7}{7} \int_0^{2\pi} \cos^4 \theta \, d\theta \int_0^\pi \sin^5 \phi \, d\phi = \ldots \] (rest is straightforward)

\[ = \frac{R^7}{7} \left( 3\pi/4 \right) \left( 16/15 \right) = 4\pi R^3/35 \]
PrepFinal Question B4

Compute the flux \( \int_S \mathbf{F} \cdot \hat{n} \, d\sigma \), where \( S \) is the hemisphere \( x^2 + y^2 + z^2 = 4 \), \( z \geq 0 \), \( \mathbf{n} \) points toward the origin and \( \mathbf{F} = (x(z-y), y(x-z), z(y-x)) \).

\[
\int_S \mathbf{F} \cdot \hat{n} \, d\sigma = -\iiint_S \nabla \cdot \mathbf{F} \, dV, \quad \text{use "-" because } \hat{n} \text{ is the inward normal}
\]

\[
= -\iiint_S (z-y) + (x-z) + (y-x) \, dV
\]

\[
= \iiint_S 0 \, dV
\]

\[
= 0
\]
Compute the line integral $\int_C \mathbf{F} \cdot d\mathbf{r}$ where $C$ is the curve given by the intersection of the sphere $x^2 + y^2 + z^2 = 4$ and the plane $z = -y$, counterclockwise when viewed from above, and $\mathbf{F} = (x^2 + y, x + y, 4y^2 - z)$.

\[
\Gamma = \int_C \mathbf{F} \cdot d\mathbf{r} = \iint_S (\nabla \times \mathbf{F}) \cdot \mathbf{n} \, d\sigma, \text{ by Stokes' Theorem.}
\]

\[
\nabla \times \mathbf{F} = \begin{vmatrix}
\hat{i} & \hat{j} & \hat{k} \\
x^2 + y^2 & x + y & 4y^2 - z \\
0 & 4y & 0
\end{vmatrix} = \begin{bmatrix} 8y \\ 0 \\ 0 \end{bmatrix}, \quad \mathbf{n} = \begin{bmatrix} x \\ 0 \\ -y \end{bmatrix}, \quad \nabla \times \mathbf{F} \cdot \mathbf{n} = 8xy
\]

\[
x^2 + y^2 + (-y)^2 = 4, \text{ so } x^2 + 2y^2 = 4, \text{ so let } x = r \cos \theta = r \cos \theta, \quad y = \sqrt{2} r \sin \theta = \sqrt{2} r \sin \theta,
\]

\[
\iint_S 8xy \, d\sigma = \int_0^{2\pi} \int_0^2 \sqrt{2} r^2 \cos \theta \sin \theta \, rdrd\theta = \sqrt{2} \int_0^{2\pi} \cos \theta \sin \theta \, d\theta \int_0^2 r^2 \, dr
\]

\[
= \sqrt{2} \int_0^{2\pi} \left(0 \right) \int_0^2 r^2 \, dr = 0
\]

EASIER METHOD: \[
\mathbf{n} = \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}, \text{ with } S \text{ being surface }
\]

\[
\mathbf{n} + z = 0 \Rightarrow \Gamma = 0,
\]

\[
\nabla \times \mathbf{F} \cdot \mathbf{n} = 0 \Rightarrow \Gamma = 0,
\]
16.7 Stokes’ Theorem

Curl describes the tendency a fluid has to __________ at a specific point. Stokes’ Theorem states that:

\[ \mathbf{F} \cdot \mathbf{dr} = \iint (\nabla \times \mathbf{F}) \cdot \hat{n} \, d\sigma, \quad \mathbf{F} = \mathbf{F}(x, y, z) \]

Note that curve C must be __________.

Stokes’ theorem can be used to calculate __________ and __________.

Historical note: Stokes’ theorem is named after Sir George Stokes, but was discovered by Sir William Thomson.
16.8 What is Divergence?

Divergence describes the tendency a fluid has to ____________.

Water is (approximately) an incompressible fluid. If you place your thumb at the end of a hose, the speed of the water ________ , because ________, or because _______.

∇ · v = 0
16.8 The Divergence Theorem

The divergence theorem states that

$$\text{flux} = \iint_S \mathbf{v} \cdot \mathbf{n} \, d\sigma = \iiint_V \nabla \cdot \mathbf{v} \, dV$$

$$\mathbf{n} = \text{unit outward normal}$$

$$\nabla \cdot \mathbf{v} = \text{divergence}$$

$$S = \text{closed surface}$$
